

# Package ‘param2moment’

April 30, 2024

**Type** Package

**Title** Raw, Central and Standardized Moments of Parametric Distributions

**Version** 0.1.2

**Date** 2024-04-30

**Description** To calculate the raw, central and standardized moments from distribution parameters. To solve the distribution parameters based on user-provided mean, standard deviation, skewness and kurtosis. Normal, skew-normal, skew-t and Tukey g-&-h distributions are supported, for now.

**License** GPL-2

**Encoding** UTF-8

**Language** en-US

**Depends** R (>= 4.4.0)

**Imports** methods

**Suggests** sn

**RoxygenNote** 7.3.1

**NeedsCompilation** no

**Author** Tingting Zhan [aut, cre, cph] (<<https://orcid.org/0000-0001-9971-4844>>)

**Maintainer** Tingting Zhan <tingtingzhan@gmail.com>

**Repository** CRAN

**Date/Publication** 2024-04-30 04:40:02 UTC

moment-class	<i>Raw, Central and Standardized Moments, and other Distribution Characteristics</i>
--------------	--

---

### Description

Up to 4th raw  $E(Y^n)$ , **central**  $E[(Y - \mu)^n]$  and **standardized moments**  $E[(Y - \mu)^n / \sigma^n]$  of the random variable

$$Y = (X - \text{location}) / \text{scale}$$

Also, the mean, standard deviation, skewness and excess kurtosis of the random variable  $X$ .

### Details

For  $Y = (X - \text{location}) / \text{scale}$ , let  $\mu = E(Y)$ , then, according to **Binomial theorem**, the 2nd to 4th central moments of  $Y$  are,

$$E[(Y - \mu)^2] = E(Y^2) - 2\mu E(Y) + \mu^2 = E(Y^2) - \mu^2$$

$$E[(Y - \mu)^3] = E(Y^3) - 3\mu E(Y^2) + 3\mu^2 E(Y) - \mu^3 = E(Y^3) - 3\mu E(Y^2) + 2\mu^3$$

$$E[(Y - \mu)^4] = E(Y^4) - 4\mu E(Y^3) + 6\mu^2 E(Y^2) - 4\mu^3 E(Y) + \mu^4 = E(Y^4) - 4\mu E(Y^3) + 6\mu^2 E(Y^2) - 3\mu^4$$

The distribution characteristics of  $Y$  are,

$$\mu_Y = \mu$$

$$\sigma_Y = \sqrt{E[(Y - \mu)^2]}$$

$$\text{skewness}_Y = E[(Y - \mu)^3] / \sigma_Y^3$$

$$\text{kurtosis}_Y = E[(Y - \mu)^4] / \sigma_Y^4 - 3$$

The distribution characteristics of  $X$  are  $\mu_X = \text{location} + \text{scale} \cdot \mu_Y$ ,  $\sigma_X = \text{scale} \cdot \sigma_Y$ ,  $\text{skewness}_X = \text{skewness}_Y$ , and  $\text{kurtosis}_X = \text{kurtosis}_Y$ .

**Slots**

distname **character** scalar, name of distribution, e.g., 'norm' for normal, 'sn' for skew-normal, 'st' for skew-*t*, and 'GH' for Tukey *g*-&-*h* distribution, following the nomenclature of **dnorm**, **dsn**, **dst** and **QuantileGH::dGH**

location, scale **numeric** scalars or **vectors**, location and scale parameters

mu **numeric** scalar or **vector**, 1st *raw* moment  $\mu = E(Y)$ . Note that the 1st central moment  $E(Y - \mu)$  and standardized moment  $E(Y - \mu)/\sigma$  are both 0.

raw2, raw3, raw4 **numeric** scalars or **vectors**, 2nd or higher *raw* moments  $E(Y^n)$ ,  $n \geq 2$

central2, central3, central4 **numeric** scalars or **vectors**, 2nd or higher *central moments*,  $\sigma^2 = E[(Y - \mu)^2]$  and  $E[(Y - \mu)^n]$ ,  $n \geq 3$

standardized3, standardized4 **numeric** scalars or **vectors**, 3rd or higher *standardized moments*, **skewness**  $E[(Y - \mu)^3]/\sigma^3$  and **kurtosis**  $E[(Y - \mu)^4]/\sigma^4$ . Note that the 2nd standardized moment is 1

**Note**

Potential name clash with function `e1071::moment`.

---

moment2GH

*Solve Tukey g-&-h Parameters from Moments*

---

**Description**

Solve Tukey *g*-, *h*- and *g*-&-*h* distribution parameters from mean, standard deviation, skewness and kurtosis.

**Usage**

```
moment2GH(mean = 0, sd = 1, skewness, kurtosis)
```

```
moment2GH_h_demo(sd = 1, kurtosis)
```

```
moment2GH_g_demo(mean = 0, sd = 1, skewness)
```

**Arguments**

mean **numeric** scalar, mean  $\mu$ , default value 0

sd **numeric** scalar, standard deviation  $\sigma$ , default value 1

skewness **numeric** scalar

kurtosis **numeric** scalar

## Details

Function `moment2GH` solves the location  $A$ , scale  $B$ , skewness  $g$  and elongation  $h$  parameters of Tukey  $g$ -&- $h$  distribution, from user-specified mean  $\mu$  (default 0), standard deviation  $\sigma$  (default 1), skewness and kurtosis.

An educational and demonstration function `moment2GH_h_demo` solves  $(B, h)$  parameters of Tukey  $h$ -distribution, from user-specified  $\sigma$  and kurtosis. This is a non-skewed distribution, thus the location parameter  $A = \mu = 0$ , and the skewness parameter  $g = 0$ .

An educational and demonstration function `moment2GH_g_demo` solves  $(A, B, g)$  parameters of Tukey  $g$ -distribution, from user-specified  $\mu$ ,  $\sigma$  and skewness. For this distribution, the elongation parameter  $h = 0$ .

## Value

Function `moment2GH` returns a **length-4 numeric vector**  $(A, B, g, h)$ .

Function `moment2GH_h_demo` returns a **length-2 numeric vector**  $(B, h)$ .

Function `moment2GH_g_demo` returns a **length-3 numeric vector**  $(A, B, g)$ .

## Examples

```
moment2GH(skewness = .2, kurtosis = .3)
```

```
moment2GH_h_demo(kurtosis = .3)
```

```
moment2GH_g_demo(skewness = .2)
```

---

moment2param

*Moment to Parameters: A Batch Process*

---

## Description

Converts multiple sets of moments to multiple sets of distribution parameters.

## Usage

```
moment2param(distname, FUN = paste0("moment2", distname), ...)
```

## Arguments

`distname` **character** scalar, distribution name. Currently supported are 'GH' for Tukey  $g$ -&- $h$  distribution, 'sn' for skew-normal distribution and 'st' for skew- $t$  distribution

`FUN` **name** or **character** scalar, (name of) **function** used to solve the distribution parameters from moments. Default is `paste0('moment2', distname)`, e.g., `moment2GH` will be used for `distname = 'GH'`. To use one of the educational functions, specify `FUN = moment2GH_g_demo` or `FUN = 'moment2GH_g_demo'`.

`...` **numeric** scalars, some or all of mean, sd, skewness and kurtosis (length will be recycled).

**Value**

Function `moment2param` returns a [list](#) of [numeric vectors](#).

**Examples**

```
skw = c(.2, .5, .8)
krt = c(.5, 1, 1.5)
moment2param(distname = 'GH', skewness = skw, kurtosis = krt)
moment2param(distname = 'st', skewness = skw, kurtosis = krt)
```

---

`moment2sn`*Solve Skew-Normal Parameters from Moments*

---

**Description**

Solve skew-normal parameters from mean, standard deviation and skewness.

**Usage**

```
moment2sn(mean = 0, sd = 1, skewness)
```

**Arguments**

<code>mean</code>	<a href="#">numeric</a> scalar, mean $\mu$ , default value 0
<code>sd</code>	<a href="#">numeric</a> scalar, standard deviation $\sigma$ , default value 1
<code>skewness</code>	<a href="#">numeric</a> scalar

**Details**

Function `moment2sn` solves the location  $\xi$ , scale  $\omega$  and slant  $\alpha$  parameters of skew-normal distribution, from user-specified mean  $\mu$  (default 0), standard deviation  $\sigma$  (default 1) and skewness.

**Value**

Function `moment2sn` returns a [length-3 numeric vector](#)  $(\xi, \omega, \alpha)$ .

**Examples**

```
moment2sn(skewness = .3)
```

---

`moment2st`*Solve Skew- $t$  Parameters from Moments*

---

### Description

Solve skew- $t$  parameters from mean, standard deviation, skewness and kurtosis.

### Usage

```
moment2st(mean = 0, sd = 1, skewness, kurtosis)
```

```
moment2t_demo(sd = 1, kurtosis)
```

### Arguments

<code>mean</code>	<code>numeric</code> scalar, mean $\mu$ , default value 0
<code>sd</code>	<code>numeric</code> scalar, standard deviation $\sigma$ , default value 1
<code>skewness</code>	<code>numeric</code> scalar
<code>kurtosis</code>	<code>numeric</code> scalar

### Details

Function `moment2st` solves the location  $\xi$ , scale  $\omega$ , slant  $\alpha$  and degree of freedom  $\nu$  parameters of skew- $t$  distribution, from user-specified mean  $\mu$  (default 0), standard deviation  $\sigma$  (default 1), skewness and kurtosis.

An educational and demonstration function `moment2t_demo` solves  $(\omega, \nu)$  parameters of  $t$ -distribution, from user-specified  $\sigma$  and kurtosis. This is a non-skewed distribution, thus the location parameter  $\xi = \mu = 0$ , and the slant parameter  $\alpha = 0$ .

### Value

Function `moment2st` returns a `length-4 numeric vector`  $(\xi, \omega, \alpha, \nu)$ .

Function `moment2t_demo` returns a `length-2 numeric vector`  $(\omega, \nu)$ .

### Examples

```
moment2st(skewness = .2, kurtosis = .3)
```

```
moment2t_demo(kurtosis = .3)
```

---

moment_GH	<i>Moments of Tukey g-&amp;-h Distribution</i>
-----------	--

---

**Description**

Moments of Tukey  $g$ -&- $h$  distribution.

**Usage**

```
moment_GH(A = 0, B = 1, g = 0, h = 0)
```

**Arguments**

A	numeric scalar or <a href="#">vector</a> , location parameter $A$
B	numeric scalar or <a href="#">vector</a> , scale parameter $B$
g	numeric scalar or <a href="#">vector</a> , skewness parameter $g$
h	numeric scalar or <a href="#">vector</a> , elongation parameter $h$

**Value**

Function [moment\\_GH](#) returns a [moment](#) object.

**References**

Raw moments of Tukey  $g$ -&- $h$  distribution: [doi:10.1002/9781118150702.ch11](https://doi.org/10.1002/9781118150702.ch11)

**Examples**

```
A = 3; B = 1.5; g = .7; h = .01
moment_GH(A = A, B = B, g = 0, h = h)
moment_GH(A = A, B = B, g = g, h = 0)
moment_GH(A = A, B = B, g = g, h = h)
```

---

moment_norm	<i>Moments of Normal Distribution</i>
-------------	---------------------------------------

---

**Description**

Moments of [normal distribution](#), parameter nomenclature follows [dnorm](#) function.

**Usage**

```
moment_norm(mean = 0, sd = 1)
```

**Arguments**

mean            **numeric** scalar or **vector**, mean parameter  $\mu$   
 sd              **numeric** scalar or **vector**, standard deviation  $\sigma$

**Value**

Function `moment_norm` returns a **moment** object.

**Examples**

```
moment_norm(mean = 1.2, sd = .7)
```

---

 moment\_sn

*Moments of Skew-Normal Distribution*

---

**Description**

Moments of **skew-normal distribution**, parameter nomenclature follows `dsn` function.

**Usage**

```
moment_sn(xi = 0, omega = 1, alpha = 0)
```

**Arguments**

xi              **numeric** scalar or **vector**, location parameter  $\xi$   
 omega          **numeric** scalar or **vector**, scale parameter  $\omega$   
 alpha          **numeric** scalar or **vector**, slant parameter  $\alpha$

**Value**

Function `moment_sn` returns a **moment** object.

**Examples**

```
xi = 2; omega = 1.3; alpha = 3
moment_sn(xi, omega, alpha)
curve(sn::dsn(x, xi = 2, omega = 1.3, alpha = 3), from = 0, to = 6)
```

---

moment_st	<i>Moments of Skew-t Distribution</i>
-----------	---------------------------------------

---

### Description

Moments of skew- $t$  distribution, parameter nomenclature follows `dst` function.

### Usage

```
moment_st(xi = 0, omega = 1, alpha = 0, nu = Inf)
```

### Arguments

<code>xi</code>	numeric scalar or <b>vector</b> , location parameter $\xi$
<code>omega</code>	numeric scalar or <b>vector</b> , scale parameter $\omega$
<code>alpha</code>	numeric scalar or <b>vector</b> , slant parameter $\alpha$
<code>nu</code>	numeric scalar or <b>vector</b> , degree of freedom $\nu$

### Value

Function `moment_st` returns a **moment** object.

### References

Raw moments of skew- $t$ : <https://arxiv.org/abs/0911.2342>

### Examples

```
xi = 2; omega = 1.3; alpha = 3; nu = 6
curve(sn::dst(x, xi = xi, omega = omega, alpha = alpha, nu = nu), from = 0, to = 6)
moment_st(xi, omega, alpha, nu)
```

---

show,moment-method	<i>Show moment</i>
--------------------	--------------------

---

### Description

Print S4 object **moment** in a pretty manner.

### Usage

```
## S4 method for signature 'moment'
show(object)
```

10

*show, moment-method*

**Arguments**

object            a [moment](#) object

**Value**

The [show](#) method for [moment](#) object does not have a returned value.
