# Package 'ChIPpeakAnno'

April 11, 2018

**Type** Package

**Title** Batch annotation of the peaks identified from either ChIP-seq, ChIP-chip experiments or any experiments resulted in large number of chromosome ranges

**Version** 3.12.7

**Author** Lihua Julie Zhu, Jianhong Ou, Jun Yu, Herve Pages, Claude Gazin, Nathan Lawson, Ryan Thompson, Simon Lin, David Lapointe and Michael Green

**Maintainer** Lihua Julie Zhu <julie.zhu@umassmed.edu>, Jianhong Ou <ou.jianhong@gmail.com>

**Depends** R (>= 3.2), methods, grid, IRanges (>= 2.11.16), Biostrings, GenomicRanges (>= 1.29.14), S4Vectors (>= 0.9.25), VennDiagram

**Imports** BiocGenerics (>= 0.1.0), GO.db, biomaRt, BSgenome, GenomicFeatures, GenomeInfoDb, matrixStats, AnnotationDbi, limma, multtest, RBGL, graph, BiocInstaller, stats, regioneR, DBI, ensembldb, Biobase, seqinr, idr, GenomicAlignments, DelayedArray, SummarizedExperiment, Rsamtools

**Suggests** reactome.db, BSgenome.Ecoli.NCBI.20080805, BSgenome.Hsapiens.UCSC.hg19, org.Ce.eg.db, org.Hs.eg.db, BSgenome.Celegans.UCSC.ce10, BSgenome.Drerio.UCSC.danRer7, EnsDb.Hsapiens.v75, EnsDb.Hsapiens.v79, TxDb.Hsapiens.UCSC.hg19.knownGene, TxDb.Hsapiens.UCSC.hg38.knownGene, gplots, BiocStyle, rtracklayer, knitr, rmarkdown, testthat, trackViewer, motifStack, OrganismDbi

**Description** The package includes functions to retrieve the sequences around the peak, obtain enriched Gene Ontology (GO) terms, find the nearest gene, exon, miRNA or custom features such as most conserved elements and other transcription factor binding sites supplied by users. Starting 2.0.5, new functions have been added for finding the peaks with bi-directional promoters with summary statistics (peaksNearBDP), for summarizing the occurrence of motifs in peaks (summarizePatternInPeaks) and for adding other IDs to annotated peaks or enrichedGO (addGeneIDs). This package leverages the biomaRt, IRanges, Biostrings, BSgenome, GO.db, multtest and stat packages.

**License** GPL (>= 2)

**LazyLoad** yes

**biocViews** Annotation, ChIPSeq, ChIPchip

**VignetteBuilder** knitr

**RoxygenNote** 5.0.1

**NeedsCompilation** no

# R topics documented:

---

`ChIPpeakAnno-package` *Batch annotation of the peaks identified from either ChIP-seq or ChIP-chip experiments.*

---

## Description

The package includes functions to retrieve the sequences around the peak, obtain enriched Gene Ontology (GO) terms, find the nearest gene, exon, miRNA or custom features such as most conserved elements and other transcription factor binding sites leveraging biomaRt, IRanges, Biostrings, BSgenome, GO.db, hypergeometric test phyper and multtest package.

## Details

| | |
|---|---|
| Package: | ChIPpeakAnno |
| Type: | Package |
| Version: | 3.0.0 |
| Date: | 2014-10-24 |
| License: | LGPL |
| LazyLoad: | yes |

## Examples

```
if(interactive()){
 data(myPeakList)
 library(EnsDb.Hsapiens.v75)
 anno <- annoGR(EnsDb.Hsapiens.v75)
 annotatedPeak <-
   annotatePeakInBatch(myPeakList[1:6], AnnotationData=anno)
}
```

addAncestors *Add GO IDs of the ancestors for a given vector of GO ids*

## Description

Add GO IDs of the ancestors for a given vector of GO IDs leveraging GO.db package

## Usage

```
addAncestors(go.ids, ontology = c("bp", "cc", "mf"))
```

## Arguments

| | |
|---|---|
| go.ids | A matrix with 4 columns: first column is GO IDs and 4th column is entrez IDs. |
| ontology | bp for biological process, cc for cellular component and mf for molecular function |

## Value

A vector of GO IDs containing the input GO IDs with the GO IDs of their ancestors added

## Author(s)

Lihua Julie Zhu

## Examples

```
go.ids = cbind(c("GO:0008150", "GO:0005576", "GO:0003674"),
               c("ND", "IDA", "ND"),
               c("BP", "BP", "BP"), c("1", "1", "1"))
addAncestors(go.ids, ontology="bp")
```

addGeneIDs *Add common IDs to annotated peaks such as gene symbol, entrez ID, ensemble gene id and refseq id.*

## Description

Add common IDs to annotated peaks such as gene symbol, entrez ID, ensemble gene id and refseq id leveraging organism annotation dataset. For example, org.Hs.eg.db is the dataset from orgs.Hs.eg.db package for human, while org.Mm.eg.db is the dataset from the org.Mm.eg.db package for mouse

## Usage

```
addGeneIDs(annotatedPeak, orgAnn, IDs2Add=c("symbol"),
           feature_id_type="ensembl_gene_id", silence=TRUE, mart)
```

## Arguments

| | |
|---|---|
| annotatedPeak | GRanges or a vector of feature IDs |
| orgAnn | organism annotation dataset such as org.Hs.eg.db |
| IDs2Add | a vector of annotation identifiers to be added |
| feature_id_type | type of ID to be annotated, default is ensembl_gene_id |
| silence | TRUE or FALSE. If TRUE, will not show unmapped entrez id for feature ids. |
| mart | mart object, see useMart of biomaRt package for details |

## Details

One of orgAnn and mart should be assigned.

- If orgAnn is given, parameter feature_id_type should be ensemble_gene_id, entrez_id, gene_symbol, gene_alias or refseq_id. And parameter IDs2Add can be set to any combination of identifiers such as "accnum", "ensembl", "ensemblprot", "ensembltrans", "entrez_id", "enzyme", "genename", "pfam", "pmid", "prosite", "refseq", "symbol", "unigene" and "uniprot". Some IDs are unique to an organism, such as "omim" for org.Hs.eg.db and "mgi" for org.Mm.eg.db.

  Here is the definition of different IDs :

  - accnum: GenBank accession numbers
  - ensembl: Ensembl gene accession numbers
  - ensemblprot: Ensembl protein accession numbers
  - ensembltrans: Ensembl transcript accession numbers
  - entrez_id: entrez gene identifiers
  - enzyme: EC numbers
  - genename: gene name
  - pfam: Pfam identifiers
  - pmid: PubMed identifiers
  - prosite: PROSITE identifiers
  - refseq: RefSeq identifiers
  - symbol: gene abbreviations
  - unigene: UniGene cluster identifiers
  - uniprot: Uniprot accession numbers
  - omim: OMIM(Mendelian Inheritance in Man) identifiers
  - mgi: Jackson Laboratory MGI gene accession numbers
- If mart is used instead of orgAnn, for valid parameter feature_id_type and IDs2Add parameters, please refer to getBM in bioMart package. Parameter feature_id_type should be one valid filter name listed by listFilters(mart) such as ensemble_gene_id. And parameter IDs2Add should be one or more valid attributes name listed by listAttributes(mart) such as external_gene_id, entrezgene, wikigene_name, or mirbase_transcript_name.

## Value

GRanges if the input is a GRanges or dataframe if input is a vector.

## Author(s)

Jianhong Ou, Lihua Julie Zhu

## Examples

```
data(annotatedPeak)
library(org.Hs.eg.db)
addGeneIDs(annotatedPeak[1:6,],orgAnn="org.Hs.eg.db",
          IDs2Add=c("symbol","omim"))
##addGeneIDs(annotatedPeak$feature[1:6],orgAnn="org.Hs.eg.db",
##           IDs2Add=c("symbol","genename"))
if(interactive()){
  mart <- useMart("ENSEMBL_MART_ENSEMBL",host="www.ensembl.org",
                dataset="hsapiens_gene_ensembl")
  ##mart <- useMart(biomart="ensembl",dataset="hsapiens_gene_ensembl")
 addGeneIDs(annotatedPeak[1:6,], mart=mart,
            IDs2Add=c("hgnc_symbol","entrezgene"))
}
```

---

`addMetadata` *Add metadata of the GRanges objects used for findOverlapsOfPeaks*

---

## Description

Add metadata to to overlapping peaks after calling findOverlapsOfPeaks.

## Usage

```
addMetadata(ol, colNames=NULL, FUN=c, ...)
```

## Arguments

| | |
|---|---|
| `ol` | An object of overlappingPeaks, which is output of findOverlapsOfPeaks. |
| `colNames` | Names of metadata column to be added. If it is NULL, addMetadata will guess what to add. |
| `FUN` | A function to be called |
| `...` | Arguments to the function call. |

## Value

return value is An object of overlappingPeaks.

## Author(s)

Jianhong Ou

## Examples

```
peaks1 <- GRanges(seqnames=c(6,6,6,6,5),
                  IRanges(start=c(1543200,1557200,1563000,1569800,167889600),
                          end=c(1555199,1560599,1565199,1573799,167893599),
                          names=c("p1","p2","p3","p4","p5")),
                  strand="+",
                  score=1:5, id=letters[1:5])
peaks2 <- GRanges(seqnames=c(6,6,6,6,5),
                   IRanges(start=c(1549800,1554400,1565000,1569400,167888600),
                           end=c(1550599,1560799,1565399,1571199,167888999),
                           names=c("f1","f2","f3","f4","f5")),
                   strand="+",
                   score=6:10, id=LETTERS[1:5])
ol <- findOverlapsOfPeaks(peaks1, peaks2)
addMetadata(ol)
```

---

annoGR-class *Class* annoGR

---

## Description

An object of class annoGR represents the annotation data could be used by annotationPeakInBatch.

## Usage

```
    ## S4 method for signature 'GRanges'
annoGR(ranges, feature="group", date, ...)
    ## S4 method for signature 'TxDb'
annoGR(ranges, feature=c(
                            "gene", "transcript", "exon",
                            "CDS", "fiveUTR", "threeUTR",
                            "microRNA", "tRNAs", "geneModel"),
                   date, source, mdata, OrganismDb)
    ## S4 method for signature 'EnsDb'
annoGR(ranges,
                   feature=c("gene", "transcript", "exon", "disjointExons"),
                   date, source, mdata)
```

## Arguments

| | |
|---|---|
| ranges | an object of GRanges, TxDb or EnsDb |
| feature | annotation type |
| date | a Date object |
| ... | could be following parameters |
| source | character, where the annotation comes from |
| mdata | data frame, metadata from annotation |
| OrganismDb | an object of OrganismDb. It is used for extracting gene symbol for geneModel group for TxDb |

### Objects from the Class

Objects can be created by calls of the form `new("annoGR", date, elementMetadata, feature, mdata, ranges,`

### Slots

**seqnames, ranges, strand, elementMetadata, seqinfo** slots inherit from GRanges. The ranges must have unique names.

`source` character, where the annotation comes from

`date` a Date object

`feature` annotation type, could be "gene", "exon", "transcript", "CDS", "fiveUTR", "threeUTR", "microRNA", "tRNAs", "geneModel" for TxDb object, or "gene", "exon" "transcript" for EnsDb object

`mdata` data frame, metadata from annotation

### Coercion

as(from, "annoGR"): Creates a annoGR object from a GRanges object.

as(from, "GRanges"): Create a GRanges object from a annoGR object.

### Methods

**info** Print basic info for annoGR object

**annoGR("TxDb"), annoGR("EnsDb")** Create a annoGR object from TxDb or EnsDb object

### Author(s)

Jianhong Ou

### Examples

```
if(interactive()){
    library(EnsDb.Hsapiens.v79)
    anno <- annoGR(EnsDb.Hsapiens.v79)
}
```

---

## annoPeaks *Annotate peaks*

---

### Description

Annotate peaks by annoGR object in the given range.

### Usage

```
annoPeaks (peaks, annoData,
          bindingType=c("nearestBiDirectionalPromoters",
                        "startSite", "endSite", "fullRange"),
          bindingRegion=c(-5000, 5000),
          ignore.peak.strand=TRUE,
          select=c("all", "bestOne"),
          ...)
```

## Arguments

| | |
|---|---|
| peaks | peak list, GRanges object |
| annoData | annotation data, GRanges object |
| bindingType | Specifying the criteria to associate peaks with annotation. Here is how to use it together with the parameter bindingRegion<br>• To obtain peaks within 5kb upstream and up to 3kb downstream of TSS within the gene body, set bindingType = "startSite" and bindingRegion = c(-5000, 3000)<br>• To obtain peaks up to 5kb upstream within the gene body and 3kb downstream of gene/Exon End, set bindingType = "endSite" and bindingRegion = c(-5000, 3000)<br>• To obtain peaks from 5kb upstream to 3kb downstream of genes/Exons , set bindingType = "fullRange" and bindingRegion = c(-5000, 3000)<br>• To obtain peaks with nearest bi-directional promoters within 5kb upstream and 3kb downstream of TSS, set bindingType = "nearestBiDirectionalPromoters" and bindingRegion = c(-5000, 3000)<br>**startSite** start position of the feature (strand is considered)<br>**endSite** end position of the feature (strand is considered)<br>**fullRange** whole range of the feature<br>**nearestBiDirectionalPromoters** nearest promoters from both direction of the peaks (strand is considered). It will report bidirectional promoters if there are promoters in both directions in the given region (defined by bindingRegion). Otherwise, it will report the closest promoter in one direction. |
| bindingRegion | Annotation range used together with bindingType, which is a vector with two integer values, default to c (-5000, 5000). The first one must be no bigger than 0, which means upstream. And the sec ond one must be no less than 1, which means downstream (1 is the site position, 2 is the next base of the site position). For details, see bindingType. |
| ignore.peak.strand | ignore the peaks strand or not. |
| select | "all" or "bestOne". Return the annotation containing all or the best one. The "bestOne" is selected by the shortest distance to the sites and then similarity between peak and annotations. Ignored if bindingType is nearestBiDirectionalPromoters. |
| ... | Not used. |

## Value

Output is a GRanges object of the annotated peaks.

## Author(s)

Jianhong Ou

## See Also

See Also as annotatePeakInBatch

## Examples

```
library(EnsDb.Hsapiens.v75)
data("myPeakList")
annoGR <- toGRanges(EnsDb.Hsapiens.v75)
seqlevelsStyle(myPeakList) <- seqlevelsStyle(annoGR)
annoPeaks(myPeakList, annoGR)
```

---

annotatedPeak *Annotated Peaks*

---

## Description

TSS annotated putative STAT1-binding regions that are identified in un-stimulated cells using ChIP-seq technology (Robertson et al., 2007)

## Usage

```
data(annotatedPeak)
```

## Format

GRanges with slot start holding the start position of the peak, slot end holding the end position of the peak, slot names holding the id of the peak, slot strand holding the strands and slot space holding the chromosome location where the peak is located. In addition, the following variables are included.

`feature` id of the feature such as ensembl gene ID

`insideFeature` upstream: peak resides upstream of the feature; downstream: peak resides downstream of the feature; inside: peak resides inside the feature; overlapStart: peak overlaps with the start of the feature; overlapEnd: peak overlaps with the end of the feature; includeFeature: peak include the feature entirely

`distancetoFeature` distance to the nearest feature such as transcription start site

`start_position` start position of the feature such as gene

`end_position` end position of the feature such as the gene

## Details

obtained by data(TSS.human.GRCh37)

data(myPeakList)

annotatePeakInBatch(myPeakList, AnnotationData = TSS.human.GRCh37, output="b", multiple=F)

## Examples

```
data(annotatedPeak)
str(annotatedPeak)
if (interactive()) {
y = annotatedPeak$distancetoFeature[!is.na(annotatedPeak$distancetoFeature)]
hist(as.numeric(as.character(y)),
     xlab="Distance To Nearest TSS", main="", breaks=1000,
ylim=c(0, 50), xlim=c(min(as.numeric(as.character(y)))-100,
max(as.numeric(as.character(y)))+100))
}
```

annotatePeakInBatch *Obtain the distance to the nearest TSS, miRNA, and/or exon for a list of peaks*

## Description

Obtain the distance to the nearest TSS, miRNA, exon et al for a list of peak locations leveraging IRanges and biomaRt package

## Usage

```
annotatePeakInBatch(myPeakList, mart, featureType = c("TSS", "miRNA","Exon"),
AnnotationData, output=c("nearestLocation", "overlapping", "both",
                         "shortestDistance", "inside",
                         "upstream&inside", "inside&downstream",
                         "upstream", "downstream",
                         "upstreamORdownstream",
                         "nearestBiDirectionalPromoters"),
multiple=c(TRUE,FALSE),
maxgap=-1L, PeakLocForDistance=c("start", "middle", "end"),
FeatureLocForDistance=c("TSS", "middle","start", "end","geneEnd"),
select=c("all", "first","last","arbitrary"),
ignore.strand=TRUE, bindingRegion=NULL, ...)
```

## Arguments

| | |
|---|---|
| myPeakList | A GRanges object |
| mart | A mart object, used if AnnotationData is not supplied, see useMart of bioMaRt package for details |
| featureType | A charcter vector used with mart argument if AnnotationData is not supplied; it's value is "TSS"", "miRNA"" or "Exon" |
| AnnotationData | A GRanges or annoGR oject. It can be obtained from function getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). Pre-compliled annotations, such as TSS.human.NCBI36, TSS.mouse.NCBIM37, TSS.rat.RGSC3.4 and TSS.zebrafish.Zv8, are provided by this package (attach them with data() function). Another method to provide annotation data is to obtain through biomaRt real time by using the parameters of mart and featureType |
| output | **nearestLocation (default)** will output the nearest features calculated as PeakLoc - FeatureLocForDistance<br>**overlapping** will output overlapping features with maximum gap specified as maxgap between peak range and feature range<br>**shortestDistance** will output nearest features<br>**both** will output all the nearest features, in addition, will output any features that overlap the peak that is not the nearest features<br>**upstream&inside** will output all upstream and overlapping features with maximum gap<br>**inside&downstream** will output all downstream and overlapping features with maximum gap |

**upstream** will output all upstream features with maximum gap.

**downstream** will output all downstream features with maximum gap.

**upstreamORdownstream** will output all upstream features with maximum gap or downstream with maximum gap

**nearestBiDirectionalPromoters** will use annoPeaks to annotate peaks. Nearest promoters from both direction of the peaks (strand is considered). It will report bidirectional promoters if there are promoters in both directions in the given region (defined by bindingRegion). Otherwise, it will report the closest promoter in one direction.

`multiple` Not applicable when output is nearest. TRUE: output multiple overlapping features for each peak. FALSE: output at most one overlapping feature for each peak. This parameter is kept for backward compatibility, please use select.

`maxgap` The maximum *gap* that is allowed between 2 ranges for the ranges to be considered as overlapping. The *gap* between 2 ranges is the number of positions that separate them. The *gap* between 2 adjacent ranges is 0. By convention when one range has its start or end strictly inside the other (i.e. non-disjoint ranges), the *gap* is considered to be -1.

`PeakLocForDistance`
Specify the location of peak for calculating distance,i.e., middle means using middle of the peak to calculate distance to feature, start means using start of the peak to calculate the distance to feature. To be compatible with previous version, by default using start

`FeatureLocForDistance`
Specify the location of feature for calculating distance,i.e., middle means using middle of the feature to calculate distance of peak to feature, start means using start of the feature to calculate the distance to feature, TSS means using start of feature when feature is on plus strand and using end of feature when feature is on minus strand, geneEnd means using end of feature when feature is on plus strand and using start of feature when feature is on minus strand. To be compatible with previous version, by default using TSS

`select` "all" may return multiple overlapping peaks, "first" will return the first overlapping peak, "last" will return the last overlapping peak and "arbitrary" will return one of the overlapping peaks.

`ignore.strand` When set to TRUE, the strand information is ignored in the annotation.

`bindingRegion` Annotation range used for annoPeaks, which is a vector with two integer values, default to c (-5000, 5000). The first one must be no bigger than 0. And the sec ond one must be no less than 1. Once bindingRegion is defined, annotation will based on annoPeaks. Here is how to use it together with the parameter output and FeatureLocForDistance.

- To obtain peaks with nearest bi-directional promoters within 5kb upstream and 3kb downstream of TSS, set output = "nearestBiDirectionalPromoters" and bindingRegion = c(-5000, 3000)
- To obtain peaks within 5kb upstream and up to 3kb downstream of TSS within the gene body, set output="overlapping", FeatureLocForDistance="TSS" and bindingRegion = c(-5000, 3000)
- To obtain peaks up to 5kb upstream within the gene body and 3kb downstream of gene/Exon End, set output="overlapping", FeatureLocForDistance="geneEnd" and bindingRegion = c(-5000, 3000)

For details, see annoPeaks.

`...` Parameters could be passed to annoPeaks

## Value

An object of GRanges with slot start holding the start position of the peak, slot end holding the end position of the peak, slot space holding the chromosome location where the peak is located, slot rownames holding the id of the peak. In addition, the following variables are included.

| | |
|---|---|
| `feature` | id of the feature such as ensembl gene ID |
| `insideFeature` | upstream: peak resides upstream of the feature; downstream: peak resides downstream of the feature; inside: peak resides inside the feature; overlapStart: peak overlaps with the start of the feature; overlapEnd: peak overlaps with the end of the feature; includeFeature: peak include the feature entirely |
| `distancetoFeature` | distance to the nearest feature such as transcription start site. By default, the distance is calculated as the distance between the start of the binding site and the TSS that is the gene start for genes located on the forward strand and the gene end for genes located on the reverse strand. The user can specify the location of peak and location of feature for calculating this |
| `start_position` | start position of the feature such as gene |
| `end_position` | end position of the feature such as the gene |
| `strand` | 1 or + for positive strand and -1 or - for negative strand where the feature is located |
| `shortestDistance` | The shortest distance from either end of peak to either end the feature. |
| `fromOverlappingOrNearest` | nearest: indicates this feature's start (feature's end for features at minus strand) is closest to the peak start; Overlapping: indicates this feature overlaps with this peak although it is not the nearest feature start |

## with TSS.human.NCBI36 (Granges)
data(TSS.human.NCBI36)
annotatedPeak = annotatePeakInBatch(myPeakList[1:6],
                                    AnnotationData=TSS.human.NCBI36)
annotatedPeak

## example 3: you have a list of transcription factor biding sites from
## literature and are interested in determining the extent of the overlap
## to the list of peaks from your experiment. Prior calling the function
## annotatePeakInBatch, need to represent both dataset as RangedData
## where start is the start of the binding site, end is the end of the
## binding site, names is the name of the binding site, space and strand
## are the chromosome name and strand where the binding site is located.

myexp <- GRanges(seqnames=c(6,6,6,6,5,4,4),
                 IRanges(start=c(1543200,1557200,1563000,1569800,
                                 167889600,100,1000),

test.GR = toGRanges(test.bed)
annotatePeakInBatch(test.GR, AnnotationData = literature)
#}
```

---

`assignChromosomeRegion` *Summarize peak distribution over exon, intron, enhancer, proximal promoter, 5 prime UTR and 3 prime UTR*

---

## Description

Summarize peak distribution over exon, intron, enhancer, proximal promoter, 5 prime UTR and 3 prime UTR

## Usage

```
assignChromosomeRegion(peaks.RD, exon, TSS, utr5, utr3,
        proximal.promoter.cutoff=1000L, immediate.downstream.cutoff=1000L,
        nucleotideLevel=FALSE, precedence=NULL, TxDb=NULL)
```

## Arguments

| | |
|---|---|
| peaks.RD | peaks in GRanges: See example below |
| exon | exon data obtained from getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). This parameter is for backward compatibility only. TxDb should be used instead. |
| TSS | TSS data obtained from getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). For example, data(TSS.human.NCBI36),data(TSS.mouse.NCBIM37), data(TSS.rat.RGSC3.4) and data(TSS.zebrafish.Zv8). This parameter is for backward compatibility only. TxDb should be used instead. |
| utr5 | 5 prime UTR data obtained from getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). This parameter is for backward compatibility only. TxDb should be used instead. |
| utr3 | 3 prime UTR data obtained from getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). This parameter is for backward compatibility only. TxDb should be used instead. |
| proximal.promoter.cutoff | Specify the cutoff in bases to classify proximal promoter or enhencer. Peaks that reside within proximal.promoter.cutoff upstream from or overlap with transcription start site are classified as proximal promoters. Peaks that reside upstream of the proximal.promoter.cutoff from gene start are classified as enhancers. The default is 1000 bases. |
| immediate.downstream.cutoff | Specify the cutoff in bases to classify immediate downstream region or enhancer region. Peaks that reside within immediate.downstream.cutoff downstream of gene end but not overlap 3 prime UTR are classified as immediate downstream. Peaks that reside downstream over immediate.downstreatm.cutoff from gene end are classified as enhancers. The default is 1000 bases. |
| nucleotideLevel | Logical. Choose between peak centric and nucleotide centric view. Default=FALSE |
| precedence | If no precedence specified, double count will be enabled, which means that if a peak overlap with both promoter and 5'UTR, both promoter and 5'UTR will be incremented. If a precedence order is specified, for example, if promoter is specified before 5'UTR, then only promoter will be incremented for the same example. The values could be any conbinations of "Promoters", "immediateDownstream", "fiveUTRs", "threeUTRs", "Exons" and "Introns", Default=NULL |
| TxDb | an object of TxDb |

## Value

A list of two named vectors: percentage and jaccard (Jaccard Index). The information in the vectors:

| | |
|---|---|
| Exons | Percent or the picard index of the peaks resided in exon regions. |
| Introns | Percent or the picard index of the peaks resided in intron regions. |
| fiveUTRs | Percent or the picard index of the peaks resided in 5 prime UTR regions. |
| threeUTRs | Percent or the picard index of the peaks resided in 3 prime UTR regions. |
| Promoter | Percent or the picard index of the peaks resided in proximal promoter regions. |
| ImmediateDownstream | Percent or the picard index of the peaks resided in immediate downstream regions. |
| Intergenic.Region | Percent or the picard index of the peaks resided in intergenic regions. |

The Jaccard index, also known as Intersection over Union. The Jaccard index is between 0 and 1. The higher the index, the more significant the overlap between the peak region and the genomic features in consideration.

bdp *obtain the peaks near bi-directional promoters*

---

## Description

Obtain the peaks near bi-directional promoters. Also output percent of peaks near bi-directional promoters.

## Usage

```
bdp (peaks, annoData, maxgap=2000L, ...)
```

## Arguments

| | |
|---|---|
| peaks | peak list, GRanges object |
| annoData | annotation data, annoGR object |
| maxgap | maxgap between peak and TSS |
| ... | Not used. |

## Value

Output is a list of GRanges object of the peaks near bi-directional promoters.

## Author(s)

Jianhong Ou

## See Also

See Also as annoPeaks, annoGR

## Examples

```
if(interactive()){
  library(EnsDb.Hsapiens.v75)
  data("myPeakList")

  seqlevelsStyle(myPeakList) <- seqlevelsStyle(annoGR)
  bdp(myPeakList, annoGR)
}
```

BED2RangedData *Convert BED format to RangedData*

## Description

Convert BED format to RangedData. This function will be depreciated.

## Usage

```
BED2RangedData(data.BED,header=FALSE, ...)
```

## Arguments

| | |
|---|---|
| data.BED | BED format data frame or BED filename, please refer to http://genome.ucsc.edu/FAQ/FAQformat#for for details |
| header | TRUE or FALSE, default to FALSE, indicates whether data.BED file has BED header |
| ... | any parameter need to be passed into read.delim function |

## Value

RangedData with slot start holding the start position of the feature, slot end holding the end position of the feature, slot names holding the id of the feature, slot space holding the chromosome location where the feature is located. In addition, the following variables are included.

| | |
|---|---|
| strand | 1 for positive strand and -1 for negative strand where the feature is located. Default to 1 if not present in the BED formated data frame |

## Note

For converting the peakList in BED format to RangedData before calling annotatePeakInBatch function

## Author(s)

Lihua Julie Zhu

## See Also

See also as toGRanges.

## Examples

```
test.bed = data.frame(cbind(chrom = c("1", "2"),
                      chromStart=c("100", "1000"),
                      chromEnd=c("200", "1100"),
                      name=c("peak1", "peak2")))
test.rangedData = BED2RangedData(test.bed)
```

## bindist-class *Class* "bindist"

### Description

An object of class "bindist" represents the relevant fixed-width range of binding site from the feature and number of possible binding site in each range.

### Objects from the Class

Objects can be created by calls of the form new("bindist", counts="integer", mids="in

### Slots

counts vector of "integer" The count number in each binding range

mids vector of "integer" The center of each range relevant to feature

halfBinSize "integer", length must be 1. the fixed half-width of each binding range

bindingType a "character". could be "TSS", "geneEnd"

featureType a "character". could be "transcript", "exon"

### Methods

**$, $<-** Get or set the slot of bindist

### See Also

preparePool, peakPermTest

## binOverFeature *Aggregate peaks over bins from the TSS*

### Description

Aggregate peaks over bins from the feature sites.

### Usage

```
binOverFeature(..., annotationData=GRanges(),
                    select=c("all", "nearest"),
                    radius=5000L, nbins=50L,
                    minGeneLen=1L, aroundGene=FALSE, mbins=nbins,
                    featureSite=c("FeatureStart", "FeatureEnd", "bothEnd"),
                    PeakLocForDistance=c("all", "end","start","middle"),
                    FUN=sum, errFun=sd, xlab, ylab, main)
```

### Arguments

| | |
|---|---|
| ... | Objects of GRanges to be analyzed |
| annotationData | An object of GRanges or annoGR for annotation |
| select | Logical: annotate the peaks to all features or the nearest one |
| radius | The radius of the longest distance to feature site |
| nbins | The number of bins |
| minGeneLen | The minimal gene length |
| aroundGene | Logical: count peaks around features or a given site of the features. Default = FALSE |
| mbins | if aroundGene set as TRUE, the number of bins intra-feature. The value will be normalized by value * (radius/genelen) * (mbins/nbins) |
| featureSite | which site of features should be used for distance calculation |
| PeakLocForDistance | which site of peaks should be used for distance calculation |
| FUN | the function to be used for score calculation |
| errFun | the function to be used for errorbar calculation or values for the errorbar. |
| xlab | titles for each x axis |
| ylab | titles for each y axis |
| main | overall titles for each plot |

### Value

A data.frame with bin values.

### Author(s)

Jianhong Ou

### Examples

```
bed <- system.file("extdata", "MACS_output.bed", package="ChIPpeakAnno")
gr1 <- toGRanges(bed, format="BED", header=FALSE)
data(TSS.human.GRCh37)
binOverFeature(gr1, annotationData=TSS.human.GRCh37,
               radius=5000, nbins=10, FUN=length, errFun=0)
```

---

## binOverGene *coverage of gene body*

---

### Description

calculate the coverage of gene body per gene per bin.

### Usage

```
binOverGene(cvglists, TxDb, upstream.cutoff = 0L,
  downstream.cutoff = upstream.cutoff, nbinsGene = 100L,
  nbinsUpstream = 20L, nbinsDownstream = nbinsUpstream,
  includeIntron = FALSE, minGeneLen = nbinsGene, maxGeneLen = Inf)
```

### Arguments

| | |
|---|---|
| cvglists | A list of SimpleRleList or RleList. It represents the coverage for samples. |
| TxDb | An object of TxDb. It is used for extracting the annotations. |
| upstream.cutoff, downstream.cutoff | cutoff length for upstream or downstream of transcript. |
| nbinsGene, nbinsUpstream, nbinsDownstream | The number of bins for gene, upstream and downstream. |
| includeIntron | A logical value which indicates including intron or not. |
| minGeneLen, maxGeneLen | minimal or maximal length of gene. |

### Author(s)

Jianhong Ou

### See Also

binOverRegions, plotBinOverRegions

### Examples

```
if(interactive()){
path <- system.file("extdata", package="ChIPpeakAnno")
library(TxDb.Hsapiens.UCSC.hg19.knownGene)
library(rtracklayer)
files <- dir(path, "bigWig")
if(.Platform$OS.type != "windows"){
cvglists <- lapply(file.path(path, files), import,
                   format="BigWig", as="RleList")
names(cvglists) <- sub(".bigWig", "", files)
d <- binOverGene(cvglists, TxDb.Hsapiens.UCSC.hg19.knownGene)
plotBinOverRegions(d)
}
}
```

---

## binOverRegions *coverage of chromosome regions*

---

### Description

calculate the coverage of 5'UTR, CDS and 3'UTR per transcript per bin.

### Usage

```
binOverRegions(cvglists, TxDb, upstream.cutoff = 1000L,
  downstream.cutoff = upstream.cutoff, nbinsCDS = 100L, nbinsUTR = 20L,
  nbinsUpstream = 20L, nbinsDownstream = nbinsUpstream,
  includeIntron = FALSE, minCDSLen = nbinsCDS, minUTRLen = nbinsUTR,
  maxCDSLen = Inf, maxUTRLen = Inf)
```

### Arguments

| | |
|---|---|
| cvglists | A list of SimpleRleList or RleList. It represents the coverage for samples. |
| TxDb | An object of TxDb. It is used for extracting the annotations. |
| upstream.cutoff, downstream.cutoff | cutoff length for upstream or downstream of transcript. |
| nbinsCDS, nbinsUTR, nbinsUpstream, nbinsDownstream | The number of bins for CDS, UTR, upstream and downstream. |
| includeIntron | A logical value which indicates including intron or not. |
| minCDSLen, minUTRLen | minimal length of CDS or UTR of transcript. |
| maxCDSLen, maxUTRLen | maximal length of CDS or UTR of transctipt. |

### Author(s)

Jianhong Ou

                   format="BigWig", as="RleList")
names(cvglists) <- sub(".bigWig", "", files)
d <- binOverRegions(cvglists, TxDb.Hsapiens.UCSC.hg19.knownGene)
plotBinOverRegions(d)
}
}
```

---

## ChIPpeakAnno-deprecated

*Deprecated Functions in Package ChIPpeakAnno*

---

### Description

These functions are provided for compatibility with older versions of R only, and may be defunct as soon as the next release.

## Usage

```
findOverlappingPeaks(Peaks1, Peaks2, maxgap = -1L,
                     minoverlap=0L, multiple = c(TRUE, FALSE),
                     NameOfPeaks1 = "TF1", NameOfPeaks2 = "TF2",
                     select=c("all", "first","last","arbitrary"),
                     annotate = 0, ignore.strand=TRUE,
                     connectedPeaks=c("min", "merge"), ...)
BED2RangedData(data.BED,header=FALSE, ...)
GFF2RangedData(data.GFF,header=FALSE, ...)
```

## Arguments

| | |
|---|---|
| Peaks1 | RangedData: See example below. |
| Peaks2 | RangedData: See example below. |
| maxgap,minoverlap | Used in the internal call to findOverlaps() to detect overlaps. See ?findOverlaps in the **IRanges** package for a description of these arguments. |
| multiple | TRUE or FALSE: TRUE may return multiple overlapping peaks in Peaks2 for one peak in Peaks1; FALSE will return at most one overlapping peaks in Peaks2 for one peak in Peaks1. This parameter is kept for backward compatibility, please use select. |
| NameOfPeaks1 | Name of the Peaks1, used for generating column name. |
| NameOfPeaks2 | Name of the Peaks2, used for generating column name. |
| select | all may return multiple overlapping peaks, first will return the first overlapping peak, last will return the last overlapping peak and arbitrary will return one of the overlapping peaks. |
| annotate | Include overlapFeature and shortestDistance in the OverlappingPeaks or not. 1 means yes and 0 means no. Default to 0. |
| ignore.strand | When set to TRUE, the strand information is ignored in the overlap calculations. |
| connectedPeaks | If multiple peaks involved in overlapping in several groups, set it to "merge" will count it as only 1, while set it to "min" will count it as the minimal involved peaks in any concered groups |
| ... | Objects of GRanges or RangedData: See also findOverlapsOfPeaks. Or any parameter need to be passed into read.delim function for 2RangedData function. |
| header | TRUE or FALSE, default to FALSE, indicates whether data file has header |
| data.BED | BED format data frame or BED filename, please refer to http://genome.ucsc.edu/FAQ/FAQformat#for for details |
| data.GFF | GFF format data frame or GFF file name, please refer to http://genome.ucsc.edu/FAQ/FAQformat#for for details |

## Details

findOverlappingPeaks is now deprecated wrappers for findOverlapsOfPeaks

## See Also

Deprecated, findOverlapsOfPeaks, toGRanges

condenseMatrixByColnames *Condense matrix by colnames*

## Description

Condense matrix by colnames

## Usage

```
condenseMatrixByColnames(mx,iname,sep=";",cnt=FALSE)
```

## Arguments

| | |
|---|---|
| mx | a matrix to be condensed |
| iname | the name of the column to be condensed |
| sep | separator for condensed values,default ; |
| cnt | TRUE/FALSE specifying whether adding count column or not? |

## Value

dataframe of condensed matrix

## Author(s)

Jianhong Ou, Lihua Julie Zhu

## Examples

```
a<-matrix(c(rep(rep(1:5,2),2),rep(1:10,2)),ncol=4)
colnames(a)<-c("con.1","con.2","index.1","index.2")
condenseMatrixByColnames(a,"con.1")
condenseMatrixByColnames(a,2)
```

convert2EntrezID *Convert other common IDs to entrez gene ID.*

## Description

Convert other common IDs such as ensemble gene id, gene symbol, refseq id to entrez gene ID leveraging organism annotation dataset. For example, org.Hs.eg.db is the dataset from orgs.Hs.eg.db package for human, while org.Mm.eg.db is the dataset from the org.Mm.eg.db package for mouse.

## Usage

```
convert2EntrezID(IDs, orgAnn, ID_type="ensembl_gene_id")
```

### Arguments

| | |
|---|---|
| IDs | a vector of IDs such as ensembl gene ids |
| orgAnn | organism annotation dataset such as org.Hs.eg.db |
| ID_type | type of ID: can be ensemble_gene_id, gene_symbol or refseq_id |

### Value

vector of entrez ids

### Author(s)

Lihua Julie Zhu

### Examples

```
ensemblIDs = c("ENSG00000115956", "ENSG00000071082", "ENSG00000071054",
 "ENSG00000115594", "ENSG00000115594", "ENSG00000115598", "ENSG00000170417")
library(org.Hs.eg.db)
entrezIDs = convert2EntrezID(IDs=ensemblIDs, orgAnn="org.Hs.eg.db",
 ID_type="ensembl_gene_id")
```

---

## countPatternInSeqs *Output total number of patterns found in the input sequences*

---

### Description

Output total number of patterns found in the input sequences

### Usage

```
countPatternInSeqs(pattern, sequences)
```

### Arguments

| | |
|---|---|
| pattern | DNAstringSet object |
| sequences | a vector of sequences |

### Value

Total number of occurrence of the pattern in the sequences

### Author(s)

Lihua Julie Zhu

### See Also

summarizePatternInPeaks, translatePattern

## Examples

```
filepath =
  system.file("extdata", "examplePattern.fa", package="ChIPpeakAnno")
dict = readDNAStringSet(filepath = filepath, format="fasta", use.names=TRUE)
sequences = c("ACTGGGGGGGGCCTGGGCCCCCAAAT",
              "AAAAAACCCCTTTTGGCCATCCCGGGACGGGCCCAT",
              "ATCGAAAATTTCC")
countPatternInSeqs(pattern=dict[1], sequences=sequences)
countPatternInSeqs(pattern=dict[2], sequences=sequences)
pattern = DNAStringSet("ATNGMAA")
countPatternInSeqs(pattern=pattern, sequences=sequences)
```

---

`cumulativePercentage` *Plot the cumulative percentage tag allocation in sample*

---

## Description

Plot the difference between the cumulative percentage tag allocation in paired samples.

## Usage

```
cumulativePercentage(bamfiles, gr, input = 1, binWidth = 1000, ...)
```

## Arguments

| | |
|---|---|
| `bamfiles` | Bam file names. |
| `gr` | An object of GRanges |
| `input` | Which file name is input. default 1. |
| `binWidth` | The width of each bin. |
| `...` | parameter for summarizeOverlaps. |

## Value

A list of data.frame with the cumulative percentages.

## Author(s)

Jianhong Ou

egOrgMap *Convert between the name of the organism annotation package ("OrgDb") and the name of the organism.*

---

## Description

Give a species name and return the organism annotation package name or give an organism annotation package name then return the species name.

## Usage

```
egOrgMap(name)
```

## Arguments

| | |
|---|---|
| name | The name of the organism annotation package or the species. |

## Value

A object of character

## Author(s)

Jianhong Ou

## Examples

```
egOrgMap("org.Hs.eg.db")
egOrgMap("Mus musculus")
```

enrichedGO *Enriched Gene Ontology terms used as example*

## Description

Enriched Gene Ontology terms used as example

## Usage

```
data(enrichedGO)
```

## Format

A list of 3 dataframes.

`bp` dataframe described the enriched biological process with 9 columns
- go.id:GO biological process id
- go.term:GO biological process term
- go.Definition:GO biological process description
- Ontology: Ontology branch, i.e. BP for biological process
- count.InDataset: count of this GO term in this dataset
- count.InGenome: count of this GO term in the genome
- pvalue: pvalue from the hypergeometric test
- totaltermInDataset: count of all GO terms in this dataset
- totaltermInGenome: count of all GO terms in the genome

`mf` dataframe described the enriched molecular function with the following 9 columns
- go.id:GO molecular function id
- go.term:GO molecular function term
- go.Definition:GO molecular function description
- Ontology: Ontology branch, i.e. MF for molecular function
- count.InDataset: count of this GO term in this dataset
- count.InGenome: count of this GO term in the genome
- pvalue: pvalue from the hypergeometric test
- totaltermInDataset: count of all GO terms in this dataset
- totaltermInGenome: count of all GO terms in the genome

`cc` dataframe described the enriched cellular component the following 9 columns
- go.id:GO cellular component id
- go.term:GO cellular component term
- go.Definition:GO cellular component description
- Ontology: Ontology type, i.e. CC for cellular component
- count.InDataset: count of this GO term in this dataset
- count.InGenome: count of this GO term in the genome
- pvalue: pvalue from the hypergeometric test
- totaltermInDataset: count of all GO terms in this dataset
- totaltermInGenome: count of all GO terms in the genome

### Author(s)

Lihua Julie Zhu

### Examples

```
data(enrichedGO)
dim(enrichedGO$mf)
dim(enrichedGO$cc)
dim(enrichedGO$bp)
```

---

## estFragmentLength *estimate the fragment length*

---

### Description

estimate the fragment length for bam files

### Usage

```
estFragmentLength(bamfiles, index = bamfiles, plot = TRUE, lag.max = 1000, ...)
```

### Arguments

| | |
|---|---|
| bamfiles | The file names of the 'BAM' ('SAM' for asBam) files to be processed. |
| index | The names of the index file of the 'BAM' file being processed; this is given without the '.bai' extension. |
| plot | logical. If TRUE (the default) the acf is plotted. |
| lag.max | maximum lag at which to calculate the acf. See acf |
| ... | Not used. |

### Value

numberic vector

### Author(s)

Jianhong Ou

### Examples

```
if(interactive()){
    path <- system.file("extdata", "reads", package="MMDiffBamSubset")
    if(file.exists(path)){
        WT.AB2 <- file.path(path, "WT_2.bam")
        Null.AB2 <- file.path(path, "Null_2.bam")
        Resc.AB2 <- file.path(path, "Resc_2.bam")
        estFragmentLength(c(WT.AB2, Null.AB2, Resc.AB2))
    }
}
```

`estLibSize` *estimate the library size*

## Description

estimate the library size of bam files

## Usage

```
estLibSize(bamfiles, index = bamfiles, ...)
```

## Arguments

| | |
|---|---|
| `bamfiles` | The file names of the 'BAM' ('SAM' for asBam) files to be processed. |
| `index` | The names of the index file of the 'BAM' file being processed; this is given without the '.bai' extension. |
| `...` | Not used. |

## Value

numberic vector

## Author(s)

Jianhong Ou

## Examples

```
if(interactive()){
    path <- system.file("extdata", "reads", package="MMDiffBamSubset")
    if(file.exists(path)){
        WT.AB2 <- file.path(path, "WT_2.bam")
        Null.AB2 <- file.path(path, "Null_2.bam")
        Resc.AB2 <- file.path(path, "Resc_2.bam")
        estLibSize(c(WT.AB2, Null.AB2, Resc.AB2))
    }
}
```

`ExonPlusUtr.human.GRCh37` *Gene model with exon, 5' UTR and 3' UTR information for human sapiens (GRCh37) obtained from biomaRt*

## Description

Gene model with exon, 5' UTR and 3' UTR information for human sapiens (GRCh37) obtained from biomaRt

## Usage

```
data(ExonPlusUtr.human.GRCh37)
```

## Format

RangedData with slot start holding the start position of the exon, slot end holding the end position of the exon, slot rownames holding ensembl transcript id and slot space holding the chromosome location where the gene is located. In addition, the following variables are included.

`strand` 1 for positive strand and -1 for negative strand

`description` description of the transcript

`ensembl_gene_id` gene id

`utr5start` 5' UTR start

`utr5end` 5' UTR end

`utr3start` 3' UTR start

`utr3end` 3' UTR end

## Details

used in the examples Annotation data obtained by: mart = useMart(biomart = "ensembl", dataset = "hsapiens_gene_ensembl") ExonPlusUtr.human.GRCh37 = getAnnotation(mart=human, featureType="ExonPlusUtr")

## Examples

```
data(ExonPlusUtr.human.GRCh37)
slotNames(ExonPlusUtr.human.GRCh37)
```

---

# featureAlignedDistribution

*plot distribution in given ranges*

---

## Description

plot distribution in the given feature ranges

## Usage

```
featureAlignedDistribution(cvglists, feature.gr,
                           upstream, downstream,
                           n.tile=100, zeroAt, ...)
```

## Arguments

| | |
|---|---|
| `cvglists` | Output of featureAlignedSignal or a list of SimpleRleList or RleList |
| `feature.gr` | An object of GRanges with identical width. If the width equal to 1, you can use upstream and downstream to set the range for plot. If the width not equal to 1, you can use zeroAt to set the zero point of the heatmap. |
| `upstream, downstream` | upstream or dwonstream from the feature.gr. |
| `zeroAt` | zero point position of feature.gr |
| `n.tile` | The number of tiles to generate for each element of feature.gr, default is 100 |
| `...` | any paramters could be used by matplot |

## Value

invisible matrix of the plot.

## Author(s)

Jianhong Ou

## See Also

See Also as featureAlignedSignal, featureAlignedHeatmap

## Examples

```
cvglists <- list(A=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))),
                 B=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))))
feature.gr <- GRanges("chr1", IRanges(seq(1, 4900, 100), width=100))
featureAlignedDistribution(cvglists, feature.gr, zeroAt=50, type="l")
```

---

# featureAlignedExtendSignal

*extract signals in given ranges from bam files*

---

## Description

extract signals in the given feature ranges from bam files (DNAseq only). The reads will be extended to estimated fragement length.

## Usage

```
featureAlignedExtendSignal(bamfiles, index = bamfiles, feature.gr,
                           upstream, downstream, n.tile = 100,
                           fragmentLength, librarySize,
                           pe=c("auto", "PE", "SE"),
                           adjustFragmentLength, gal, ...)
```

## Arguments

| | |
|---|---|
| bamfiles | The file names of the 'BAM' ('SAM' for asBam) files to be processed. |
| index | The names of the index file of the 'BAM' file being processed; this is given without the '.bai' extension. |
| feature.gr | An object of GRanges with identical width. |
| upstream, downstream | upstream or dwonstream from the feature.gr. |
| n.tile | The number of tiles to generate for each element of feature.gr, default is 100 |
| fragmentLength | Estimated fragment length. |
| librarySize | Estimated library size. |
| pe | Pair-end or not. Default auto. |

adjustFragmentLength
: A numberic vector with length 1. Adjust the fragments/reads length to.

gal
: A GAlignmentsList object or a list of GAlignmentPairs. If bamfiles is missing, gal is required.

...
: Not used.

## Value

A list of matrix. In each matrix, each row record the signals for corresponding feature.

## Author(s)

Jianhong Ou

## See Also

## Examples

```
if(interactive()){
path <- system.file("extdata", package="MMDiffBamSubset")
if(file.exists(path)){
    WT.AB2 <- file.path(path, "reads", "WT_2.bam")
    Null.AB2 <- file.path(path, "reads", "Null_2.bam")
    Resc.AB2 <- file.path(path, "reads", "Resc_2.bam")
    peaks <- file.path(path, "peaks", "WT_2_Macs_peaks.xls")
    estLibSize(c(WT.AB2, Null.AB2, Resc.AB2))
    feature.gr <- toGRanges(peaks, format="MACS")
    feature.gr <- feature.gr[seqnames(feature.gr)=="chr1" &
                         start(feature.gr)>3000000 &
                         end(feature.gr)<75000000]
    sig <- featureAlignedExtendSignal(c(WT.AB2, Null.AB2, Resc.AB2),
                           feature.gr=reCenterPeaks(feature.gr, width=1),
                           upstream = 505,
                           downstream = 505,
                           n.tile=101,
                           fragmentLength=250,
                           librarySize=1e9)
    featureAlignedHeatmap(sig, reCenterPeaks(feature.gr, width=1010),
                      zeroAt=.5, n.tile=101)
}
}
```

---

# featureAlignedHeatmap *Heatmap representing signals in given ranges*

---

## Description

plot heatmap in the given feature ranges

## Usage

```
featureAlignedHeatmap(cvglists, feature.gr, upstream, downstream,
             zeroAt, n.tile=100,
             annoMcols=c(), sortBy=names(cvglists)[1],
             color=colorRampPalette(c("yellow", "red"))(50),
             lower.extreme, upper.extreme,
             margin=c(0.1, 0.01, 0.15, 0.1), gap=0.01,
             newpage=TRUE, gp=gpar(fontsize=10),
             ...)
```

## Arguments

| | |
|---|---|
| `cvglists` | Output of featureAlignedSignal or a list of SimpleRleList or RleList |
| `feature.gr` | An object of GRanges with identical width. If the width equal to 1, you can use upstream and downstream to set the range for plot. If the width not equal to 1, you can use zeroAt to set the zero point of the heatmap. |
| `upstream, downstream` | upstream or dwonstream from the feature.gr. It must keep same as featureAlignedSignal. It is used for x-axis label. |
| `zeroAt` | zero point position of feature.gr |
| `n.tile` | The number of tiles to generate for each element of feature.gr, default is 100 |
| `annoMcols` | The columns of metadata of feature.gr that specifies the annotations shown of the right side of the heatmap. |
| `sortBy` | Sort the feature.gr by columns by annoMcols and then the signals of the given samples. Default is the first sample. Set to NULL to disable sort. |
| `color` | vector of colors used in heatmap |
| `lower.extreme, upper.extreme` | The lower and upper boundary value of each samples |
| `margin` | Margin for of the plot region. |
| `gap` | Gap between each heatmap columns. |
| `newpage` | Call grid.newpage or not. Default, TRUE |
| `gp` | A gpar object can be used for text. |
| `...` | Not used. |

## Value

invisible gList object.

## Author(s)

Jianhong Ou

### Examples

```
cvglists <- list(A=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))),
                 B=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))))
feature.gr <- GRanges("chr1", IRanges(seq(1, 4900, 100), width=100))
feature.gr$anno <- rep(c("type1", "type2"), c(25, 24))
featureAlignedHeatmap(cvglists, feature.gr, zeroAt=50, annoMcols="anno")
```

---

## featureAlignedSignal *extract signals in given ranges*

---

### Description

extract signals in the given feature ranges

### Usage

```
featureAlignedSignal(cvglists, feature.gr,
                     upstream, downstream,
                     n.tile=100, ...)
```

### Arguments

| | |
|---|---|
| `cvglists` | List of SimpleRleList or RleList |
| `feature.gr` | An object of GRanges with identical width. |
| `upstream, downstream` | Set the feature.gr to upstream and dwonstream from the center of the feature.gr if they are set. |
| `n.tile` | The number of tiles to generate for each element of feature.gr, default is 100 |
| `...` | Not used. |

### Value

A list of matrix. In each matrix, each row record the signals for corresponding feature. rownames of the matrix show the seqnames and coordinates.

### Author(s)

Jianhong Ou

### See Also

See Also as featureAlignedHeatmap, featureAlignedDistribution

### Examples

cvglists <- list(A=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))),
                 B=RleList(chr1=Rle(sample.int(5000, 100),
                                    sample.int(300, 100))))
feature.gr <- GRanges("chr1", IRanges(seq(1, 4900, 100), width=100))
featureAlignedSignal(cvglists, feature.gr)
```

`findEnhancers` *Find possible enhancers depend on DNA interaction data*

## Description

Find possible enhancers by data from chromosome conformation capture techniques such as 3C, 5C or HiC.

## Usage

```
findEnhancers(peaks, annoData, DNAinteractiveData,
              bindingType=c("nearestBiDirectionalPromoters",
                            "startSite", "endSite"),
              bindingRegion=c(-5000, 5000),
              ignore.peak.strand=TRUE, ...)
```

## Arguments

`peaks` peak list, GRanges object

`annoData` annotation data, GRanges object

`DNAinteractiveData`
DNA interaction data, GRanges object with interaction blocks informations.

`bindingType` Specifying the criteria to associate peaks with annotation. Here is how to use it together with the parameter bindingRegion. The annotation will be shift to a new position depend on the DNA interaction region.

- To obtain peaks within 5kb upstream and up to 3kb downstream of shift TSS within the gene body, set bindingType = "startSite" and bindingRegion = c(-5000, 3000)
- To obtain peaks up to 5kb upstream within the gene body and 3kb downstream of shift gene/Exon End, set bindingType = "endSite" and bindingRegion = c(-5000, 3000)
- To obtain peaks with nearest bi-directional enhancer regions within 5kb upstream and 3kb downstream of shift TSS, set bindingType = "nearestBiDirectionalPromoters" and bindingRegion = c(-5000, 3000)

**startSite** start position of the feature (strand is considered)

**endSite** end position of the feature (strand is considered)

**nearestBiDirectionalPromoters** nearest enhancer regions from both direction of the peaks (strand is considered). It will report bidirectional enhancer regions if there are enhancer regions in both directions in the given region (defined by bindingRegion). Otherwise, it will report the closest enhancer regions in one direction.

`bindingRegion` Annotation range used together with bindingType, which is a vector with two integer values, default to c (-5000, 5000). The first one must be no bigger than 0. And the sec ond one must be no less than 1. For details, see bindingType.

`ignore.peak.strand`
ignore the peaks strand or not.

`...` Not used.

## Value

Output is a GRanges object of the annotated peaks.

## Author(s)

Jianhong Ou

## See Also

See Also as annotatePeakInBatch

## Examples

```
bed <- system.file("extdata",
                   "wgEncodeUmassDekker5CGm12878PkV2.bed.gz",
                   package="ChIPpeakAnno")
DNAinteractiveData <- toGRanges(gzfile(bed))
library(EnsDb.Hsapiens.v75)
annoData <- toGRanges(EnsDb.Hsapiens.v75, feature="gene")
data("myPeakList")
findEnhancers(myPeakList[500:1000], annoData, DNAinteractiveData)
```

---

# findOverlappingPeaks *Find the overlapping peaks for two peak ranges.*

---

## Description

Find the overlapping peaks for two input peak ranges.

This function is to keep the backward compatibility with previous versions for RangedData object.

The new function findOverlapsOfPeaks is recommended.

Convert RangedData to GRanges with toGRanges function.

## Usage

```
findOverlappingPeaks(Peaks1, Peaks2, maxgap = -1L,
    minoverlap=0L, multiple = c(TRUE, FALSE),
    NameOfPeaks1 = "TF1", NameOfPeaks2 = "TF2",
    select=c("all", "first","last","arbitrary"), annotate = 0,
    ignore.strand=TRUE,
    connectedPeaks=c("min", "merge"), ...)
```

## Arguments

| | |
|---|---|
| Peaks1 | RangedData: See example below. |
| Peaks2 | RangedData: See example below. |
| maxgap,minoverlap | Used in the internal call to findOverlaps() to detect overlaps. See ?findOverlaps in the **IRanges** package for a description of these arguments. |

| | |
|---|---|
| multiple | TRUE or FALSE: TRUE may return multiple overlapping peaks in Peaks2 for one peak in Peaks1; FALSE will return at most one overlapping peaks in Peaks2 for one peak in Peaks1. This parameter is kept for backward compatibility, please use select. |
| NameOfPeaks1 | Name of the Peaks1, used for generating column name. |
| NameOfPeaks2 | Name of the Peaks2, used for generating column name. |
| select | all may return multiple overlapping peaks, first will return the first overlapping peak, last will return the last overlapping peak and arbitrary will return one of the overlapping peaks. |
| annotate | Include overlapFeature and shortestDistance in the OverlappingPeaks or not. 1 means yes and 0 means no. Default to 0. |
| ignore.strand | When set to TRUE, the strand information is ignored in the overlap calculations. |
| connectedPeaks | If multiple peaks involved in overlapping in several groups, set it to "merge" will count it as only 1, while set it to "min" will count it as the minimal involved peaks in any concered groups |
| ... | Objects of GRanges or RangedData: See also findOverlapsOfPeaks. |

## Details

Efficiently perform overlap queries with an interval tree implemented in IRanges.

## Value

| | |
|---|---|
| OverlappingPeaks | a data frame consists of input peaks information with added information: overlapFeature (upstream: peak1 resides upstream of the peak2; downstream: peak1 resides downstream of the peak2; inside: peak1 resides inside the peak2 entirely; overlapStart: peak1 overlaps with the start of the peak2; overlapEnd: peak1 overlaps with the end of the peak2; includeFeature: peak1 include the peak2 entirely) and shortestDistance (shortest distance between the overlapping peaks) |
| MergedPeaks | RangedData contains merged overlapping peaks |

}
```

---

`findOverlapsOfPeaks` *Find the overlapped peaks among two or more set of peaks.*

---

## Description

Find the overlapping peaks for two or more (less than five) set of peak ranges.

## Usage

```
findOverlapsOfPeaks(..., maxgap=-1L, minoverlap=0L,
                ignore.strand=TRUE, connectedPeaks=c("min", "merge", "keepAll"))
```

## Arguments

| | |
|---|---|
| `...` | Objects of GRanges: See example below. |
| `maxgap,minoverlap` | Used in the internal call to `findOverlaps()` to detect overlaps. See `?findOverlaps` in the **IRanges** package for a description of these arguments. |
| `ignore.strand` | When set to TRUE, the strand information is ignored in the overlap calculations. |
| `connectedPeaks` | If multiple peaks involved in overlapping in several groups, set it to "merge" will count it as 1, while set it to "min" will count it as the minimal involved peaks in any group of connected/overlapped peaks. |

## Details

Efficiently perform overlap queries with an interval tree implemented with GRanges.

## Value

return value is An object of overlappingPeaks.

| | |
|---|---|
| venn_cnt | an object of VennCounts |
| peaklist | a list consists of all overlapping peaks or unique peaks |
| uniquePeaks | an object of GRanges consists of all unique peaks |
| mergedPeaks | an object of GRanges consists of all merged overlapping peaks |
| peaksInMergedPeaks | an object of GRanges consists of all peaks in each samples involved in the overlapping peaks |
| overlappingPeaks | a list of data frame consists of the annotation of all the overlapped peaks |
| all.peaks | a list of GRanges object which contain the input peaks with formated rownames. |

```

`findVennCounts` *Obtain Venn Counts for Venn Diagram, internal function for makeVennDigram*

## Description

Obtain Venn Counts for two peak ranges using chromosome ranges or feature field, internal function for makeVennDigram

## Usage

```
findVennCounts(Peaks, NameOfPeaks, maxgap = -1L, minoverlap = 0L,
               totalTest, useFeature=FALSE)
```

## Arguments

| | |
|---|---|
| `Peaks` | RangedDataList: See example below. |
| `NameOfPeaks` | Character vector to specify the name of Peaks, e.g., c("TF1", "TF2"), this will be used as label in the Venn Diagram. |
| `maxgap,minoverlap` | Used in the internal call to `findOverlaps()` to detect overlaps. See ?`findOverlaps` in the **IRanges** package for a description of these arguments. |
| `totalTest` | Numeric value to specify the total number of tests performed to obtain the list of peaks. |
| `useFeature` | TRUE or FALSE, default FALSE, true means using feature field in the RangedData for calculating overlap, false means using chromosome range for calculating overlap. |

## Value

| | |
|---|---|
| `p.value` | hypergeometric testing result |
| `vennCounts` | vennCounts objects containing counts for Venn Diagram generation, see details in limma package vennCounts |

## Author(s)

Lihua Julie Zhu

## See Also

makeVennDiagram

getAllPeakSequence *Obtain genomic sequences around the peaks*

## Description

Obtain genomic sequences around the peaks leveraging the BSgenome and biomaRt package

## Usage

```
getAllPeakSequence(myPeakList, upstream = 200L, downstream = upstream,
                   genome, AnnotationData)
```

## Arguments

| | |
|---|---|
| myPeakList | An object of GRanges: See example below |
| upstream | upstream offset from the peak start, e.g., 200 |
| downstream | downstream offset from the peak end, e.g., 200 |
| genome | BSgenome object or mart object. Please refer to available.genomes in BSgenome package and useMart in bioMaRt package for details |
| AnnotationData | RangedData used if mart object is parsed in which can be obtained from getAnnotation with featureType="TSS". For example, data(TSS.human.NCBI36), data(TSS.mouse.NCBIM data(GO.rat.RGSC3.4) and data(TSS.zebrafish.Zv8). If not supplied, then annotation will be obtained from biomaRt automatically using the mart object |

## Value

GRanges with slot start holding the start position of the peak, slot end holding the end position of the peak, slot rownames holding the id of the peak and slot seqnames holding the chromosome where the peak is located. In addition, the following variables are included:

| | |
|---|---|
| upstream | upstream offset from the peak start |
| downstream | downstream offset from the peak end |
| sequence | the sequence obtained |

## Author(s)

Lihua Julie Zhu, Jianhong Ou

## References

Durinck S. et al. (2005) BioMart and Bioconductor: a powerful link between biological biomarts and microarray data analysis. Bioinformatics, 21, 3439-3440.

## Examples

```
#### use Annotation data from BSgenome
peaks <- GRanges(seqnames=c("NC_008253", "NC_010468"),
                 IRanges(start=c(100, 500), end=c(300, 600),
                         names=c("peak1", "peak2")))
library(BSgenome.Ecoli.NCBI.20080805)
seq <- getAllPeakSequence(peaks, upstream=20, downstream=20, genome=Ecoli)
write2FASTA(seq, file="test.fa")
```

`getAnnotation` *Obtain the TSS, exon or miRNA annotation for the specified species*

## Description

Obtain the TSS, exon or miRNA annotation for the specified species using the biomaRt package

## Usage

```
getAnnotation(mart,
              featureType=c("TSS","miRNA", "Exon", "5utr", "3utr",
                            "ExonPlusUtr", "transcript"))
```

## Arguments

| | |
|---|---|
| `mart` | A mart object, see useMart of biomaRt package for details. |
| `featureType` | TSS, miRNA, Exon, 5'UTR, 3'UTR, transcript or Exon plus UTR. The default is TSS. |

## Value

GRanges or RangedData with slot start holding the start position of the feature, slot end holding the end position of the feature, slot names holding the id of the feature, slot space holding the chromosome location where the feature is located. In addition, the following variables are included.

| | |
|---|---|
| `strand` | 1 for positive strand and -1 for negative strand where the feature is located |
| `description` | description of the feeature such as gene |

## Note

For featureType of TSS, start is the transcription start site if strand is 1 (plus strand), otherwise, end is the transcription start site

## Author(s)

Lihua Julie Zhu, Jianhong Ou

## References

Durinck S. et al. (2005) BioMart and Bioconductor: a powerful link between biological biomarts and microarray data analysis. Bioinformatics, 21, 3439-3440.

## Examples

```
if (interactive())
{
  mart <- useMart(biomart="ensembl", dataset="hsapiens_gene_ensembl")
  Annotation <- getAnnotation(mart, featureType="TSS")
}
```

getEnrichedGO *Obtain enriched gene ontology (GO) terms that near the peaks*

## Description

Obtain enriched gene ontology (GO) terms based on the features near the enriched peaks using GO.db package and GO gene mapping package such as org.Hs.db.eg to obtain the GO annotation and using hypergeometric test (phyper) and multtest package for adjusting p-values

## Usage

```
getEnrichedGO(annotatedPeak, orgAnn,
              feature_id_type="ensembl_gene_id",
              maxP=0.01,
              minGOterm=10, multiAdjMethod=NULL,
              condense=FALSE,
              removeAncestorByPval=NULL,
              keepByLevel=NULL)
```

## Arguments

| | |
|---|---|
| annotatedPeak | A GRanges object or a vector of feature IDs |
| orgAnn | Organism annotation package such as org.Hs.eg.db for human and org.Mm.eg.db for mouse, org.Dm.eg.db for fly, org.Rn.eg.db for rat, org.Sc.eg.db for yeast and org.Dr.eg.db for zebrafish |
| feature_id_type | The feature type in annotatedPeak such as ensembl_gene_id, refseq_id, gene_symbol or entrez_id |
| maxP | The maximum p-value to be considered to be significant |
| minGOterm | The minimum count in a genome for a GO term to be included |
| multiAdjMethod | The multiple testing procedures, for details, see mt.rawp2adjp in multtest package |
| condense | Condense the results or not. |
| removeAncestorByPval | Remove ancestor by p-value. P-value is calculated by fisher exact test. If gene number in all of the children is significant greater than it in parent term, the parent term will be removed from the list. |
| keepByLevel | If the shortest path from the go term to 'all' is greater than the given level, the term will be removed. |

## Value

A list with 3 elements

| | |
|---|---|
| bp | enriched biological process with the following 9 variables<br>go.id:GO biological process id<br>go.term:GO biological process term<br>go.Definition:GO biological process description<br>Ontology: Ontology branch, i.e. BP for biological process |

count.InDataset: count of this GO term in this dataset
count.InGenome: count of this GO term in the genome
pvalue: pvalue from the hypergeometric test
totaltermInDataset: count of all GO terms in this dataset
totaltermInGenome: count of all GO terms in the genome

`mf` enriched molecular function with the following 9 variables
go.id:GO molecular function id
go.term:GO molecular function term
go.Definition:GO molecular function description
Ontology: Ontology branch, i.e. MF for molecular function
count.InDataset: count of this GO term in this dataset
count.InGenome: count of this GO term in the genome
pvalue: pvalue from the hypergeometric test
totaltermInDataset: count of all GO terms in this dataset
totaltermInGenome: count of all GO terms in the genome

`cc` enriched cellular component the following 9 variables
go.id:GO cellular component id
go.term:GO cellular component term
go.Definition:GO cellular component description
Ontology: Ontology type, i.e. CC for cellular component
count.InDataset: count of this GO term in this dataset
count.InGenome: count of this GO term in the genome
pvalue: pvalue from the hypergeometric test
totaltermInDataset: count of all GO terms in this dataset
totaltermInGenome: count of all GO terms in the genome

    dim(enriched.GO$bp)
    enriched.GO$cc
}
```

---

`getEnrichedPATH` *Obtain enriched PATH that near the peaks*

---

## Description

Obtain enriched PATH that are near the peaks using path package such as reactome.db and path mapping package such as org.Hs.db.eg to obtain the path annotation and using hypergeometric test (phyper) and multtest package for adjusting p-values

## Usage

```
getEnrichedPATH(annotatedPeak, orgAnn, pathAnn,
                feature_id_type="ensembl_gene_id",
                maxP=0.01, minPATHterm=10, multiAdjMethod=NULL)
```

## Arguments

| | |
|---|---|
| `annotatedPeak` | GRanges such as data(annotatedPeak) or a vector of feature IDs |
| `orgAnn` | organism annotation package such as org.Hs.eg.db for human and org.Mm.eg.db for mouse, org.Dm.eg.db for fly, org.Rn.eg.db for rat, org.Sc.eg.db for yeast and org.Dr.eg.db for zebrafish |
| `pathAnn` | pathway annotation package such as KEGG.db, reactome.db |
| `feature_id_type` | the feature type in annotatedPeakRanges such as ensembl_gene_id, refseq_id, gene_symbol or entrez_id |
| `maxP` | maximum p-value to be considered to be significant |
| `minPATHterm` | minimum count in a genome for a path to be included |
| `multiAdjMethod` | multiple testing procedures, for details, see mt.rawp2adjp in multtest package |

## Value

A dataframe of enriched path with the following variables.

| | |
|---|---|
| `path.id` | KEGG PATH ID |
| `EntrezID` | Entrez ID |
| `count.InDataset` | count of this PATH in this dataset |
| `count.InGenome` | count of this PATH in the genome |
| `pvalue` | pvalue from the hypergeometric test |
| `totaltermInDataset` | count of all PATH in this dataset |

totaltermInGenome
: count of all PATH in the genome

PATH
: PATH name

---

# getVennCounts *Obtain Venn Counts for Venn Diagram, internal function for makeVennDigram*

---

## Description

Obtain Venn Counts for peak ranges using chromosome ranges or feature field, internal function for makeVennDigram

## Usage

```
getVennCounts(..., maxgap = -1L, minoverlap=0L,
    by=c("region", "feature", "base"),
    ignore.strand=TRUE, connectedPeaks=c("min", "merge", "keepAll"))
```

## Arguments

...
: Objects of GRanges or RangedData: See example below.

maxgap,minoverlap
: Used in the internal call to `findOverlaps()` to detect overlaps. See `?findOverlaps` in the **IRanges** package for a description of these arguments.

| | |
|---|---|
| by | region, feature or base, default region. feature means using feature field in the RangedData or GRanges for calculating overlap, region means using chromosome range for calculating overlap, and base means using calculating overlap in nucleotide level. |
| ignore.strand | When set to TRUE, the strand information is ignored in the overlap calculations. |
| connectedPeaks | If multiple peaks involved in overlapping in several groups, set it to "merge" will count it as only 1, while set it to "min" will count it as the minimal involved peaks in any concered groups |

## Value

| | |
|---|---|
| vennCounts | vennCounts objects containing counts for Venn Diagram generation, see details in limma package vennCounts |

## Author(s)

Jianhong Ou

## See Also

```

---

GFF2RangedData *Convert GFF format to RangedData*

---

## Description

Convert GFF format to RangedData. This function will be depreciated. Use function toGRanges instead.

### Usage

```
GFF2RangedData(data.GFF,header=FALSE, ...)
```

### Arguments

| | |
|---|---|
| data.GFF | GFF format data frame or GFF file name, please refer to http://genome.ucsc.edu/FAQ/FAQformat#for for details |
| header | TRUE or FALSE, default to FALSE, indicates whether data.GFF file has GFF header |
| ... | any parameter need to be passed into read.delim function |

### Value

RangedData with slot start holding the start position of the feature, slot end holding the end position of the feature, slot names holding the id of the feature, slot space holding the chromosome location where the feature is located. In addition, the following variables are included.

| | |
|---|---|
| strand | 1 for positive strand and -1 for negative strand where the feature is located. |

### Note

For converting the peakList in GFF format to RangedData before calling annotatePeakInBatch function

### Author(s)

Lihua Julie Zhu

### Examples

```
test.GFF = data.frame(cbind(seqname  = c("chr1", "chr2"),
source=rep("Macs", 2),
feature=rep("peak", 2),
start=c("100", "1000"),
end=c("200", "1100"),
score=c(60, 26),
strand=c(1, -1),
frame=c(".", 2),
group=c("peak1", "peak2")))
test.rangedData = GFF2RangedData(test.GFF)
```

---

## HOT.spots *High Occupancy of Transcription Related Factors regions*

---

### Description

High Occupancy of Transcription Related Factors regions of human (hg19)

### Usage

```
data("HOT.spots")
```

## Format

An object of GRangesList

## Details

How to generated the data:

temp <- tempfile()

url <- "http://metatracks.encodenets.gersteinlab.org"

download.file(file.path(url, "HOT_All_merged.tar.gz"), temp)

temp2 <- tempfile()

download.file(file.path(url, "HOT_intergenic_All_merged.tar.gz"), temp2)

untar(temp, exdir=dirname(temp))

untar(temp2, exdir=dirname(temp))

f <- dir(dirname(temp), "bed$")

HOT.spots <- sapply(file.path(dirname(temp), f), toGRanges, format="BED")

names(HOT.spots) <- gsub("_merged.bed", "", f)

HOT.spots <- sapply(HOT.spots, unname)

HOT.spots <- GRangesList(HOT.spots)

save(list="HOT.spots",

file="data/HOT.spots.rda",

compress="xz", compression_level=9)

```

IDRfilter *Filter peaks by IDR (irreproducible discovery rate)*

## Description

Using IDR to assess the consistency of replicate experiments and obtain a high-confidence single set of peaks

## Usage

```
IDRfilter(peaksA, peaksB, bamfileA, bamfileB,
          maxgap=-1L, minoverlap=0L, singleEnd=TRUE,
          IDRcutoff=0.01, ...)
```

## Arguments

| | |
|---|---|
| peaksA, peaksB | peaklist, GRanges object. |
| bamfileA, bamfileB | file path of bam files. |
| maxgap,minoverlap | Used in the internal call to findOverlaps() to detect overlaps. See ?findOverlaps in the **IRanges** package for a description of these arguments. |
| singleEnd | (Default TRUE) A logical indicating if reads are single or paired-end. |
| IDRcutoff | If the IDR no less than IDRcutoff, the peak will be removed. |
| ... | Not used. |

## Value

An object GRanges

          peaksB=toGRanges(Resc.AB2.Peaks, format="MACS")
          IDRfilter(peaksA, peaksB,
```

```
                        bamfileA, bamfileB)
  }
}
```

---

makeVennDiagram *Make Venn Diagram from a list of peaks*

---

## Description

Make Venn Diagram from two or more peak ranges, Also calculate p-value to determine whether those peaks overlap significantly.

## Usage

```
makeVennDiagram(Peaks, NameOfPeaks, maxgap = -1L, minoverlap = 0L,
                totalTest, by = c("region", "feature", "base"),
                ignore.strand = TRUE, connectedPeaks = c("min",
                "merge", "keepAll"), method = c("hyperG",
                "permutation"), TxDb, ...)
```

## Arguments

| | |
|---|---|
| Peaks | A list of peaks in GRanges format: See example below. |
| NameOfPeaks | Character vector to specify the name of Peaks, e.g., c("TF1", "TF2"). This will be used as label in the Venn Diagram. |
| maxgap,minoverlap | Used in the internal call to `findOverlaps()` to detect overlaps. See `?findOverlaps` in the **IRanges** package for a description of these arguments. |
| totalTest | Numeric value to specify the total number of tests performed to obtain the list of peaks. It should be much larger than the number of peaks in the largest peak set. |
| by | "region, "feature" or "base", default = "region". feature means using feature field in the GRanges for calculating overlap, region means using chromosome range for calculating overlap, and base means calculating overlap in nucleotide level. |
| ignore.strand | Logical: when set to TRUE, the strand information is ignored in the overlap calculations. |
| connectedPeaks | If multiple peaks involved in overlapping in several groups, set it to "merge" will count it as only 1, while set it to "min" will count it as the minimal involved peaks in any connected peak group. |
| method | method used for p value calculation. hyperG means hypergeometric test and permutation means peakPermTest |
| TxDb | An object of TxDb |
| ... | Additional arguments to be passed to venn.diagram |

## Details

For customized graph options, please see venn.diagram in VennDiagram package.

## Value

In addition to a Venn Diagram produced, a p.value is calculated by hypergeometric test to determine whether the peaks or features are overlapped significantly.

## Author(s)

Lihua Julie Zhu, Jianhong Ou

    makeVennDiagram(list(peaks1, peaks2), NameOfPeaks=c("TF1", "TF2"),
                    totalTest=100,scaled=FALSE, euler.d=FALSE)

    makeVennDiagram(list(peaks1, peaks2), NameOfPeaks=c("TF1", "TF2"),
                    totalTest=100)

    ###### 4-way diagram using annotated feature instead of chromosome ranges

    makeVennDiagram(list(peaks1, peaks2, peaks1, peaks2),
                    NameOfPeaks=c("TF1", "TF2","TF3", "TF4"),
                    totalTest=100, by="feature",
                    main = "Venn Diagram for 4 peak lists",
                    fill=c(1,2,3,4))
}
```

---

# mergePlusMinusPeaks *Merge peaks from plus strand and minus strand*

---

## Description

Merge peaks from plus strand and minus strand within certain distance apart, and output merged peaks as bed format.

## Usage

```
mergePlusMinusPeaks(peaks.file,
   columns=c("name", "chromosome", "start", "end", "strand",
             "count", "count", "count", "count"),
   sep = "\t", header = TRUE,  distance.threshold = 100,
   plus.strand.start.gt.minus.strand.end = TRUE, output.bedfile)
```

## Arguments

| | |
|---|---|
| peaks.file | Specify the peak file. The peak file should contain peaks from both plus and minus strand |
| columns | Specify the column names in the peak file |
| sep | Specify column delimiter, default tab-delimited |
| header | Specify whether the file has a header row, default TRUE |
| distance.threshold | Specify the maximum gap allowed between the plus stranded and the nagative stranded peak |
| plus.strand.start.gt.minus.strand.end | Specify whether plus strand peak start greater than the paired negative strand peak end. Default to TRUE |
| output.bedfile | Specify the bed output file name |

## Value

output the merged peaks in bed file and a data frame of the bed format

`myPeakList` *An example GRanges object representing a ChIP-seq peak dataset*

---

## Description

the putative STAT1-binding regions identified in un-stimulated cells using ChIP-seq technology (Robertson et al., 2007)

## Usage

```
data(myPeakList)
```

## Format

GRanges with slot rownames containing the ID of peak as character, slot start containing the start position of the peak, slot end containing the end position of the peak and seqnames containing the chromosome where the peak is located.

## Source

Robertson G, Hirst M, Bainbridge M, Bilenky M, Zhao Y, et al. (2007) Genome-wide profiles of STAT1 DNA association using chromatin immunoprecipitation and massively parallel sequencing. Nat Methods 4:651-7

## Examples

```
data(myPeakList)
slotNames(myPeakList)
```

---

`oligoFrequency` *get the oligonucleotide frequency*

---

## Description

Prepare the oligonucleotide frequency for given Markov order.

## Usage

```
oligoFrequency(sequence, MarkovOrder = 3L, last = 1e+06)
```

## Arguments

| | |
|---|---|
| `sequence` | The sequences packaged in DNAStringSet, DNAString object or output of function getAllPeakSequence. |
| `MarkovOrder` | Markov order. |
| `last` | The sequence size to be analyzed. |

## Value

A numeric vector.

## Author(s)

Jianhong Ou

## See Also

See Also as oligoSummary

## Examples

```
oligoFrequency(DNAString("AATTCGACGTACAGATGACTAGACT"))
```

---

# oligoSummary *Output a summary of consensus in the peaks*

---

## Description

Calculate the z-scores of all combinations of oligonucleotide in a given length by Markove chain.

## Usage

```
oligoSummary(sequence, oligoLength = 6L, freqs = NULL,
             MarkovOrder = 3L, quickMotif = FALSE, revcomp=FALSE,
             maxsize=100000)
```

## Arguments

| | |
|---|---|
| sequence | The sequences packaged in DNAStringSet, DNAString object or output of function getAllPeakSequence. |
| oligoLength | The length of oligonucleotide. |
| freqs | Output of function frequency. |
| MarkovOrder | The order of Markov chain. |
| quickMotif | Generate the motif by z-score of not. |
| revcomp | Consider both the given strand and the reverse complement strand when searching for motifs in a complementable alphabet (ie DNA). Default, FALSE. |
| maxsize | Maximum allowed dataset size (in length of sequences). |

## Value

A list is returned.

| | |
|---|---|
| zscore | A numeric vector. The z-scores of each oligonucleotide. |
| counts | A numeric vector. The counts number of each oligonucleotide. |
| motifs | a list of motif matrix. |

See Also as frequency

## Examples

```
if(interactive()){
    data(annotatedPeak)
    library(BSgenome.Hsapiens.UCSC.hg19)
    seq <- getAllPeakSequence(annotatedPeak[1:100],
                 upstream=20,
                 downstream=20,
                 genome=Hsapiens)
    oligoSummary(seq)
}
```

---

# peakPermTest *Permutation Test for two given peak lists*

---

## Description

Performs a permutation test to seee if there is an association between two given peak lists.

## Usage

```
peakPermTest(peaks1, peaks2, ntimes=100,
             seed=as.integer(Sys.time()),
             mc.cores=getOption("mc.cores", 2L),
             maxgap=-1L, pool,
             TxDb, bindingDistribution,
             bindingType=c("TSS", "geneEnd"),
             featureType=c("transcript", "exon"),
             seqn=NA, ...)
```

## Arguments

| | |
|---|---|
| peaks1, peaks2 | an object of GRanges |
| ntimes | number of permutations |
| seed | random seed |
| mc.cores | The number of cores to use. see mclapply. |
| maxgap | See findOverlaps in the IRanges package for a description of these arguments. |

| | |
|---|---|
| pool | an object of permPool |
| TxDb | an object of TxDb |
| bindingDistribution | an object of bindist |
| bindingType | where the peaks should bind, TSS or geneEnd |
| featureType | what annotation type should be used for detecting the binding distribution. |
| seqn | default is NA, which means not filter the universe pool for sampling. Otherwise the universe pool will be filtered by the seqnames in seqn. |
| ... | further arguments to be passed to numOverlaps. |

## Value

A list of class permTestResults. See permTest

peaksNearBDP *obtain the peaks near bi-directional promoters*

## Description

Obtain the peaks near bi-directional promoters. Also output percent of peaks near bi-directional promoters.

## Usage

```
peaksNearBDP(myPeakList, AnnotationData, MaxDistance=5000L, ...)
```

## Arguments

| | |
|---|---|
| myPeakList | GRanges or RangedData: See example below |
| AnnotationData | annotation data obtained from getAnnotation or customized annotation of class GRanges containing additional variable: strand (1 or + for plus strand and -1 or - for minus strand). For example, data(TSS.human.NCBI36), data(TSS.mouse.NCBIM37), data(TSS.rat.RGSC3.4) and data(TSS.zebrafish.Zv8). |
| MaxDistance | Specify the maximum gap allowed between the peak and nearest gene |
| ... | Not used |

## Value

A list of 4

| | |
|---|---|
| peaksWithBDP | annotated Peaks containing bi-directional promoters.<br>GRangesList with slot start holding the start position of the peak, slot end holding the end position of the peak, slot space holding the chromosome location where the peak is located, slot rownames holding the id of the peak. In addition, the following variables are included.<br>feature: id of the feature such as ensembl gene ID<br>insideFeature: upstream: peak resides upstream of the feature; downstream: peak resides downstream of the feature; inside: peak resides inside the feature; overlapStart: peak overlaps with the start of the feature; overlapEnd: peak overlaps with the end of the feature; includeFeature: peak include the feature entirely.<br>distancetoFeature: distance to the nearest feature such as transcription start site. By default, the distance is calculated as the distance between the start of the binding site and the TSS that is the gene start for genes located on the forward strand and the gene end for genes located on the reverse strand. The user can specify the location of peak and location of feature for calculating this<br>feature_range: start and end position of the feature such as gene<br>feature_strand: 1 or + for positive strand and -1 or - for negative strand where the feature is located |
| percentPeaksWithBDP | The percent of input peaks containing bi-directional promoters |
| n.peaks | The total number of input peaks |
| n.peaksWithBDP | The # of input peaks containing bi-directional promoters |

## permPool-class *Class* "permPool"

---

### Description

An object of class "permPool" represents the possible locations to do permutation test.

### Objects from the Class

Objects can be created by calls of the form new("permPool", grs="GRangesList", N="integer").

### Slots

grs object of "GRangesList" The list of binding ranges

N vector of "integer", permutation number for each ranges

### Methods

**$, $<-** Get or set the slot of permPool

### See Also

preparePool, peakPermTest

pie1 *Pie Charts*

## Description

Draw a pie chart with percentage

## Usage

```
pie1(x, labels = names(x), edges = 200,
                  radius = 0.8, clockwise = FALSE,
                  init.angle = if (clockwise) 90 else 0,
                  density = NULL, angle = 45,
                  col = NULL, border = NULL, lty = NULL,
                  main = NULL, percentage=TRUE, rawNumber=FALSE,
                  digits=3, cutoff=0.01,
                  legend=FALSE, legendpos="topright", legendcol=2,
                  radius.innerlabel = radius, ...)
```

## Arguments

| | |
|---|---|
| x | a vector of non-negative numerical quantities. The values in x are displayed as the areas of pie slices. |
| labels | one or more expressions or character strings giving names for the slices. Other objects are coerced by as.graphicsAnnot. For empty or NA (after coercion to character) labels, no label nor pointing line is drawn. |
| edges | the circular outline of the pie is approximated by a polygon with this many edges. |
| radius | the pie is drawn centered in a square box whose sides range from -1 to 1. If the character strings labeling the slices are long it may be necessary to use a smaller radius. |
| clockwise | logical indicating if slices are drawn clockwise or counter clockwise (i.e., mathematically positive direction), the latter is default. |
| init.angle | number specifying the starting angle (in degrees) for the slices. Defaults to 0 (i.e., "3 o'clock") unless clockwise is true where init.angle defaults to 90 (degrees), (i.e., "12 o'clock"). |
| density | the density of shading lines, in lines per inch. The default value of NULL means that no shading lines are drawn. Non-positive values of density also inhibit the drawing of shading lines. |
| angle | the slope of shading lines, given as an angle in degrees (counter-clockwise). |
| col | a vector of colors to be used in filling or shading the slices. If missing a set of 6 pastel colours is used, unless density is specified when par("fg") is used. |
| border, lty | (possibly vectors) arguments passed to polygon which draws each slice. |
| main | an overall title for the plot. |
| percentage | logical. Add percentage in the figure or not. default TRUE. |
| rawNumber | logical. Instead percentage, add raw number in the figure or not. default FALSE. |

| | |
|---|---|
| digits | When set percentage as TRUE, how many significant digits are to be used for percentage. see format. default 3. |
| cutoff | When percentage is TRUE, if the percentage is lower than cutoff, it will NOT be shown. default 0.01. |
| legend | logical. Instead of lable, draw legend for the pie. default, FALSE. |
| legendpos, legendcol | legend position and legend columns. see legend |
| radius.innerlabel | position of percentage or raw number label relative to the circle. |
| ... | graphical parameters can be given as arguments to pie. They will affect the main title and labels only. |

# plotBinOverRegions *plot the coverage of regions*

---

## Description

plot the output of binOverRegions or binOverGene

## Usage

```
plotBinOverRegions(dat, ...)
```

## Arguments

| | |
|---|---|
| dat | A list of matrix which indicate the coverage of regions per bin |
| ... | Parameters could be used by matplot |

## Author(s)

Jianhong Ou

## See Also

binOverRegions, binOverGene

## Examples

```
if(interactive()){
path <- system.file("extdata", package="ChIPpeakAnno")
library(TxDb.Hsapiens.UCSC.hg19.knownGene)
library(rtracklayer)
files <- dir(path, "bigWig")

cvglists <- lapply(file.path(path, files), import,
                   format="BigWig", as="RleList")
names(cvglists) <- sub(".bigWig", "", files)
d <- binOverGene(cvglists, TxDb.Hsapiens.UCSC.hg19.knownGene)
plotBinOverRegions(d)
}
}
```

---

`preparePool` *prepare data for permutation test*

---

## Description

prepare data for permutation test peakPermTest

## Usage

```
preparePool(TxDb, template, bindingDistribution,
            bindingType = c("TSS", "geneEnd"),
            featureType = c("transcript", "exon"),
            seqn = NA)
```

## Arguments

| | |
|---|---|
| `TxDb` | an object of TxDb |
| `template` | an object of GRanges |
| `bindingDistribution` | an object of bindist |
| `bindingType` | the relevant position to features |
| `featureType` | feature type, transcript or exon. |
| `seqn` | seqnames. If given, the pool for permutation will be restrict in the given chromosomes. |

## Value

a list with two elements, grs, a list of GRanges. N, the numbers of elements should be drawn from in each GRanges.

## Author(s)

Jianhong Ou

## See Also

peakPermTest, bindist

## Examples

```
if(interactive()){
    path <- system.file("extdata", package="ChIPpeakAnno")
    peaksA <- toGRanges(file.path(path, "peaks.narrowPeak"),
                        format="narrowPeak")
    peaksB <- toGRanges(file.path(path, "MACS2_peaks.xls"), format="MACS2")
    library(TxDb.Hsapiens.UCSC.hg19.knownGene)
    ppp <- preparePool(TxDb.Hsapiens.UCSC.hg19.knownGene,
                       peaksA, bindingType="TSS",
                       featureType="transcript")
}
```

---

`reCenterPeaks` *re-center the peaks*

---

## Description

Create a new list of peaks based on the peak centers of given list.

## Usage

```
reCenterPeaks(peaks, width=2000L, ...)
```

## Arguments

| | |
|---|---|
| `peaks` | An object of GRanges or annoGR. |
| `width` | The width of new peaks |
| `...` | Not used. |

## Value

An object of GRanges.

## Author(s)

Jianhong Ou

## Examples

```
reCenterPeaks(GRanges("chr1", IRanges(1, 10)), width=2)
```

summarizeOverlapsByBins *Perform overlap queries between reads and genomic features by bins*

## Description

summarizeOverlapsByBins extends summarizeOverlaps by providing fixed window size and step to split each feature into bins and then do queries. It will return counts by signalSummaryFUN, which applied to bins in one feature, for each feature.

## Usage

```
summarizeOverlapsByBins(targetRegions, reads,
                            windowSize=50, step=10,
                            signalSummaryFUN=max,
                            mode=countByOverlaps, ...)
```

## Arguments

| | |
|---|---|
| targetRegions | A GRanges object of genomic regions of interest. |
| reads | A GRanges, GRangesList GAlignments, GAlignmentsList, GAlignmentPairs or BamFileList object that represents the data to be counted by summarizeOverlaps. |
| windowSize | Size of windows |
| step | Step of windows |
| signalSummaryFUN | function, which will be applied to the bins in each feature. |
| mode | mode can be one of the pre-defined count methods. see summarizeOverlaps. default is countByOverlaps, alia of countOverlaps(features, reads, ignore.strand=ignore.strand) |
| ... | Additional arguments passed to summarizeOverlaps. |

## Value

A RangedSummarizedExperiment object. The assays slot holds the counts, rowRanges holds the annotation from features.

## Author(s)

Jianhong Ou

## Examples

```
fls <- list.files(system.file("extdata", package="GenomicAlignments"),
              recursive=TRUE, pattern="*bam$", full=TRUE)
names(fls) <- basename(fls)
genes <- GRanges(
    seqnames = c(rep("chr2L", 4), rep("chr2R", 5), rep("chr3L", 2)),
    ranges = IRanges(c(1000, 3000, 4000, 7000, 2000, 3000, 3600,
                       4000, 7500, 5000, 5400),
                     width=c(rep(500, 3), 600, 900, 500, 300, 900,
                             300, 500, 500),
                     names=letters[1:11]))
se <- summarizeOverlapsByBins(genes, fls, windowSize=50, step=10)
```

summarizePatternInPeaks
*Output a summary of the occurrence of each pattern in the sequences.*

## Description

Output a summary of the occurrence of each pattern in the sequences.

## Usage

```
summarizePatternInPeaks(patternFilePath, format = "fasta",skip=0L,
                        BSgenomeName, peaks, outfile, append = FALSE)
```

## Arguments

| | |
|---|---|
| patternFilePath | A character vector containing the path to the file to read the patterns from. |
| format | Either "fasta" (the default) or "fastq" |
| skip | Single non-negative integer. The number of records of the pattern file to skip before beginning to read in records. |
| BSgenomeName | BSgenome object. Please refer to available.genomes in BSgenome package for details |
| peaks | GRanges or RangedData containing the peaks |
| outfile | A character vector containing the path to the file to write the summary output. |
| append | TRUE or FALSE, default FALSE |

## Value

A data frame with 3 columns as n.peaksWithPattern (number of peaks with the pattern), n.totalPeaks (total number of peaks in the input) and Pattern (the corresponding pattern). The summary will consider both strand (including reverse complement).

## Author(s)

Lihua Julie Zhu

## Examples

```
peaks = RangedData(IRanges(start=c(100, 500), end=c(300, 600),
                           names=c("peak1", "peak2")),
                   space=c("NC_008253", "NC_010468"))
filepath =system.file("extdata", "examplePattern.fa",
                      package="ChIPpeakAnno")
library(BSgenome.Ecoli.NCBI.20080805)
summarizePatternInPeaks(patternFilePath=filepath, format="fasta",
                        skip=0L, BSgenomeName=Ecoli, peaks=peaks)
```

tileCount *Perform overlap queries between reads and genome by windows*

## Description

tileCount extends summarizeOverlaps by providing fixed window size and step to split whole genome into windows and then do queries. It will return counts in each windows.

## Usage

```
tileCount(reads, genome, windowSize=1e6, step=1e6,
                      keepPartialWindow=FALSE,
                      mode=countByOverlaps, ...)
```

## Arguments

| | |
|---|---|
| reads | A GRanges, GRangesList GAlignments, GAlignmentsList, GAlignmentPairs or BamFileList object that represents the data to be counted by summarizeOverlaps. |
| genome | The object from/on which to get/set the sequence information. |
| windowSize | Size of windows |
| step | Step of windows |
| keepPartialWindow | Keep last partial window or not. |
| mode | mode can be one of the pre-defined count methods. see summarizeOverlaps. default is countByOverlaps, alia of countOverlaps(features, reads, ignore.strand=ignore.strand) |
| ... | Additional arguments passed to summarizeOverlaps. |

## Value

A RangedSummarizedExperiment object. The assays slot holds the counts, rowRanges holds the annotation from genome.

## Author(s)

Jianhong Ou

## Examples

```
fls <- list.files(system.file("extdata", package="GenomicAlignments"),
             recursive=TRUE, pattern="*bam$", full=TRUE)
names(fls) <- basename(fls)
genes <- GRanges(seqlengths = c(chr2L=7000, chr2R=10000))
se <- tileCount(fls, genes, windowSize=1000, step=500)
```

`tileGRanges` *Slide windows on a given GRanges object*

## Description

tileGRanges returns a set of genomic regions by sliding the windows in a given step. Each window is called a "tile".

## Usage

```
tileGRanges(targetRegions, windowSize, step, keepPartialWindow=FALSE, ...)
```

## Arguments

| | |
|---|---|
| `targetRegions` | A GRanges object of genomic regions of interest. |
| `windowSize` | Size of windows |
| `step` | Step of windows |
| `keepPartialWindow` | Keep last partial window or not. |
| `...` | Not used. |

## Value

A GRanges object.

## Author(s)

Jianhong Ou

## Examples

```
genes <- GRanges(
    seqnames = c(rep("chr2L", 4), rep("chr2R", 5), rep("chr3L", 2)),
    ranges = IRanges(c(1000, 3000, 4000, 7000, 2000, 3000, 3600,
                       4000, 7500, 5000, 5400),
                     width=c(rep(500, 3), 600, 900, 500, 300, 900,
                             300, 500, 500),
                     names=letters[1:11]))
se <- tileGRanges(genes, windowSize=50, step=10)
```

toGRanges *Convert dataset to GRanges*

## Description

Convert UCSC BED format and its variants, such as GFF, or any user defined dataset such as RangedDate or MACS output file to GRanges

## Usage

```
    ## S4 method for signature 'character'
toGRanges(data, format=c("BED", "GFF",
                                  "MACS", "MACS2", "MACS2.broad",
                                  "narrowPeak", "broadPeak",
                                  "others"),
                  header=FALSE, comment.char="#", colNames=NULL, ...)
    ## S4 method for signature 'connection'
toGRanges(data, format=c("BED", "GFF",
                                  "MACS", "MACS2", "MACS2.broad",
                                  "narrowPeak", "broadPeak",
                                  "others"),
                  header=FALSE, comment.char="#", colNames=NULL, ...)
    ## S4 method for signature 'data.frame'
toGRanges(data, colNames=NULL, ...)
    ## S4 method for signature 'TxDb'
toGRanges(data, feature=c("gene", "transcript", "exon",
                                   "CDS", "fiveUTR", "threeUTR",
                                   "microRNA", "tRNAs", "geneModel"),
                  OrganismDb, ...)
    ## S4 method for signature 'EnsDb'
toGRanges(data,
                  feature=c("gene", "transcript", "exon", "disjointExons"),
                  ...)
```

## Arguments

| | |
|---|---|
| data | an object of data.frame, TxDb or EnsDb, or the file name of data to be imported. Alternatively, data can be a readable txt-mode connection (See ?read.table). |
| format | data format. If the data format is set to BED, GFF, narrowPeak or broadPeak, please refer to http://genome.ucsc.edu/FAQ/FAQformat#format1 for column order. "MACS" is for converting the excel output file from MACS1. "MACS2" is for converting the output file from MACS2. |
| feature | annotation type |
| header | A logical value indicating whether the file contains the names of the variables as its first line. If missing, the value is determined from the file format: header is set to TRUE if and only if the first row contains one fewer field than the number of columns. |
| comment.char | character: a character vector of length one containing a single character or an empty string. Use "" to turn off the interpretation of comments altogether. |

| | |
|---|---|
| colNames | If the data format is set to "others", colname must be defined. And the colname must contain space, start and end. The column name for the chromosome # should be named as space. |
| ... | parameters passed to read.table |
| OrganismDb | an object of OrganismDb. It is used for extracting gene symbol for geneModel group for TxDb |

## Value

An object of GRanges

## Author(s)

Jianhong Ou

## Examples

```
macs <- system.file("extdata", "MACS_peaks.xls", package="ChIPpeakAnno")
macsOutput <- toGRanges(macs, format="MACS")
if(interactive()){
  ## MACS connection
  macs <- readLines(macs)
  macs <- textConnection(macs)
  macsOutput <- toGRanges(macs, format="MACS")
  ## bed
  toGRanges(system.file("extdata", "MACS_output.bed", package="ChIPpeakAnno"),
            format="BED")
  ## narrowPeak
  toGRanges(system.file("extdata", "peaks.narrowPeak", package="ChIPpeakAnno"),
            format="narrowPeak")
  ## broadPeak
  toGRanges(system.file("extdata", "TAF.broadPeak", package="ChIPpeakAnno"),
            format="broadPeak")
  ## MACS2
  toGRanges(system.file("extdata", "MACS2_peaks.xls", package="ChIPpeakAnno"),
            format="MACS2")
  ## GFF
  toGRanges(system.file("extdata", "GFF_peaks.gff", package="ChIPpeakAnno"),
            format="GFF")
  ## EnsDb
  library(EnsDb.Hsapiens.v75)
  toGRanges(EnsDb.Hsapiens.v75, feature="gene")
  ## TxDb
  library(TxDb.Hsapiens.UCSC.hg19.knownGene)
  toGRanges(TxDb.Hsapiens.UCSC.hg19.knownGene, feature="gene")
  ## data.frame
  macs <- system.file("extdata", "MACS_peaks.xls", package="ChIPpeakAnno")
  macs <- read.delim(macs, comment.char="#")
  toGRanges(macs)
}
```

translatePattern *translate pattern from IUPAC Extended Genetic Alphabet to regular expression*

## Description

translate pattern containing the IUPAC nucleotide ambiguity codes to regular expression. For example,Y->[C|T], R-> [A|G], S-> [G|C], W-> [A|T], K-> [T|U|G], M-> [A|C], B-> [C|G|T], D-> [A|G|T], H-> [A|C|T], V-> [A|C|G] and N-> [A|C|T|G].

## Usage

```
translatePattern(pattern)
```

## Arguments

| | |
|---|---|
| pattern | a character vector with the IUPAC nucleotide ambiguity codes |

## Value

a character vector with the pattern represented as regular expression

## Author(s)

Lihua Julie Zhu

## See Also

countPatternInSeqs, summarizePatternInPeaks

## Examples

```
pattern1 = "AACCNWMK"
translatePattern(pattern1)
```

TSS.human.GRCh37 *TSS annotation for human sapiens (GRCh37) obtained from biomaRt*

## Description

TSS annotation for human sapiens (GRCh37) obtained from biomaRt

## Usage

```
data(TSS.human.GRCh37)
```

### Format

A GRanges object with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

### Details

The dataset TSS.human.GRCh37 was obtained by:

mart = useMart(biomart = "ENSEMBL_MART_ENSEMBL", host="grch37.ensembl.org", path="/biomart/martservice",
dataset = "hsapiens_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

### Examples

```
data(TSS.human.GRCh37)
slotNames(TSS.human.GRCh37)
```

---

## TSS.human.GRCh38 *TSS annotation for human sapiens (GRCh38) obtained from biomaRt*

---

### Description

TSS annotation for human sapiens (GRCh38) obtained from biomaRt

### Usage

```
data(TSS.human.GRCh38)
```

### Format

A 'GRanges' [package "GenomicRanges"] object with ensembl id as names.

### Details

used in the examples Annotation data obtained by:

mart = useMart(biomart = "ensembl", dataset = "hsapiens_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

### Examples

```
data(TSS.human.GRCh38)
slotNames(TSS.human.GRCh38)
```

## TSS.human.NCBI36 *TSS annotation for human sapiens (NCBI36) obtained from biomaRt*

### Description

TSS annotation for human sapiens (NCBI36) obtained from biomaRt

### Usage

```
data(TSS.human.NCBI36)
```

### Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

### Details

used in the examples Annotation data obtained by:

mart = useMart(biomart = "ensembl_mart_47", dataset = "hsapiens_gene_ensembl", archive=TRUE)

getAnnotation(mart, featureType = "TSS")

### Examples

```
data(TSS.human.NCBI36)
slotNames(TSS.human.NCBI36)
```

## TSS.mouse.GRCm38 *TSS annotation data for Mus musculus (GRCm38.p1) obtained from biomaRt*

### Description

TSS annotation data for Mus musculus (GRCm38.p1) obtained from biomaRt

### Usage

```
data(TSS.mouse.GRCm38)
```

### Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

## Details

Annotation data obtained by:

mart = useMart(biomart = "ensembl", dataset = "mmusculus_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

## Examples

```
data(TSS.mouse.GRCm38)
slotNames(TSS.mouse.GRCm38)
```

---

# TSS.mouse.NCBIM37 *TSS annotation data for mouse (NCBIM37) obtained from biomaRt*

---

## Description

TSS annotation data for mouse (NCBIM37) obtained from biomaRt

## Usage

```
data(TSS.mouse.NCBIM37)
```

## Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

## Details

Annotation data obtained by:

mart = useMart(biomart = "ensembl", dataset = "mmusculus_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

## Examples

```
data(TSS.mouse.NCBIM37)
slotNames(TSS.mouse.NCBIM37)
```

## TSS.rat.RGSC3.4 *TSS annotation data for rat (RGSC3.4) obtained from biomaRt*

### Description

TSS annotation data for rat (RGSC3.4) obtained from biomaRt

### Usage

```
data(TSS.rat.RGSC3.4)
```

### Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

### Details

Annotation data obtained by:

mart = useMart(biomart = "ensembl", dataset = "rnorvegicus_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

### Examples

```
data(TSS.rat.RGSC3.4)
slotNames(TSS.rat.RGSC3.4)
```

## TSS.rat.Rnor_5.0 *TSS annotation data for Rattus norvegicus (Rnor_5.0) obtained from biomaRt*

### Description

TSS annotation data for Rattus norvegicus (Rnor_5.0) obtained from biomaRt

### Usage

```
data(TSS.rat.Rnor_5.0)
```

### Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

## Details

Annotation data obtained by:

mart = useMart(biomart = "ensembl", dataset = "rnorvegicus_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

## Examples

```
data(TSS.rat.Rnor_5.0)
slotNames(TSS.rat.Rnor_5.0)
```

---

# TSS.zebrafish.Zv8 *TSS annotation data for zebrafish (Zv8) obtained from biomaRt*

---

## Description

A GRanges object to annotate TSS for zebrafish (Zv8) obtained from biomaRt

## Usage

```
data(TSS.zebrafish.Zv8)
```

## Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

## Details

Annotation data obtained by: mart <- useMart(biomart="ENSEMBL_MART_ENSEMBL", host="may2009.archive.ense
path="/biomart/martservice", dataset="drerio_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

## Examples

```
data(TSS.zebrafish.Zv8)
slotNames(TSS.zebrafish.Zv8)
```

## TSS.zebrafish.Zv9 *TSS annotation for Danio rerio (Zv9) obtained from biomaRt*

### Description

TSS annotation for Danio rerio (Zv9) obtained from biomaRt

### Usage

```
data(TSS.zebrafish.Zv9)
```

### Format

GRanges with slot start holding the start position of the gene, slot end holding the end position of the gene, slot names holding ensembl gene id, slot seqnames holding the chromosome location where the gene is located and slot strand holding the strinad information. In addition, the following variables are included.

`description` description of the gene

### Details

Annotation data obtained by:

mart <- useMart(biomart="ENSEMBL_MART_ENSEMBL", host="mar2015.archive.ensembl.org", path="/biomart/martservice", dataset="drerio_gene_ensembl")

getAnnotation(mart, featureType = "TSS")

### Examples

```
data(TSS.zebrafish.Zv9)
slotNames(TSS.zebrafish.Zv9)
```

## wgEncodeTfbsV3 *transcription factor binding site clusters (V3) from ENCODE*

### Description

possible binding pool for human (hg19) from transcription factor binding site clusters (V3) from ENCODE data and removed the HOT spots

### Usage

```
data("wgEncodeTfbsV3")
```

### Format

An object of GRanges.

## Details

How to generate the data:

```
temp <- tempfile()
download.file(file.path("http://hgdownload.cse.ucsc.edu", "goldenPath",
"hg19", "encodeDCC",
"wgEncodeRegTfbsClustered",
"wgEncodeRegTfbsClusteredV3.bed.gz"), temp)
data <- read.delim(gzfile(temp, "r"), header=FALSE)
unlink(temp)
colnames(data)[1:4] <- c("seqnames", "start", "end", "TF")
wgEncodeRegTfbsClusteredV3 <- GRanges(as.character(data$seqnames),
IRanges(data$start, data$end),
TF=data$TF)
data(HOT.spots)
hot <- reduce(unlist(HOT.spots))
ol <- findOverlaps(wgEncodeRegTfbsClusteredV3, hot)
wgEncodeTfbsV3 <- wgEncodeRegTfbsClusteredV3[-unique(queryHits(ol))]
wgEncodeTfbsV3 <- reduce(wgEncodeTfbsV3)
save(list="wgEncodeTfbsV3",
file="data/wgEncodeTfbsV3.rda",
compress="xz", compression_level=9)
```

## Source

http://hgdownload.cse.ucsc.edu/goldenPath/hg19/encodeDCC/ wgEncodeRegTfbsClustered/wgEncodeRegTfbsClustere

## Examples

```
data(wgEncodeTfbsV3)
head(wgEncodeTfbsV3)
```

---

`write2FASTA` *Write sequences to a file in fasta format*

---

## Description

Write the sequences obtained from getAllPeakSequence to a file in fasta format leveraging writeFASTA in Biostrings package. FASTA is a simple file format for biological sequence data. A FASTA format file contains one or more sequences and there is a header line which begins with a > proceeding each sequence.

## Usage

```
write2FASTA(mySeq, file="", width=80)
```

### Arguments

| | |
|---|---|
| mySeq | GRanges with varibles name and sequence ,e.g., results obtained from getAllPeakSequence |
| file | Either a character string naming a file or a connection open for reading or writing. If "" (the default for write2FASTA), then the function writes to the standard output connection (the console) unless redirected by sink |
| width | The maximum number of letters per line of sequence |

### Value

Output as FASTA file format to the naming file or the console.

### Author(s)

Lihua Julie Zhu

### Examples

```
peaksWithSequences = GRanges(seqnames=c("1", "2"),
IRanges(start=c(1000, 2000),
end=c(1010, 2010),
names=c("id1", "id2")),
sequence= c("CCCCCCCCGGGGG", "TTTTTTTAAAAAA"))

write2FASTA(peaksWithSequences, file="testseq.fasta", width=50)
```

---

## xget *Return the value from a Bimap objects*

---

### Description

Search by name for an Bimap object.

### Usage

```
xget(x, envir, mode, ifnotfound=NA, inherits,
    output=c("all", "first"))
```

### Arguments

| | |
|---|---|
| x, envir, mode, ifnotfound, inherits | see mget |
| output | return the all or first item for each query |

### Value

a character vector

### Author(s)

Jianhong Ou

## See Also

See Also as mget, mget

## Examples

```
library(org.Hs.eg.db)
xget(as.character(1:10), org.Hs.egSYMBOL)
